Back when I was furiously chasing an early five band DXCC from another location here in town I had an end-fed 130 foot inverted L and one ground rod and no radials. Used the antenna on 80 & 40 and didn't have much competition in the pileups with 500W. I've been attributing the success of that antenna to ground conditions. Dark, heavy Pennsylvania loam. This location should be even better in this respect because it's the same soil but it's damper. I have to cut down a lot of bamboo to make room around the tree for the two antennas. There's a message in that.

> Better is radials, as many as you can put down - length does not
> matter! Drop a wire from the bottom of your tank to the radials
> center..

Oops: Hold on right there. I live on a rather strange patch of ground. The property is only 65' x 45' (roughly) and it's overpopulated by five huge old hardwood trees all of them well over 75' tall, and one small cedar cabin. Radial farms are out, some radials, ground rods and

voltage-fed half wave verticals are in.

> . . . . The ground rod does nothing
> otherwise, and may actually harm your antenna pattern if connected
> directly to the tank...

Never read about that one before except as they apply to filament
chokes, looks like a good alternative to a pile of beads.

> Or, you can stop reading all the Hennie Pennies who run around clucking

hi

not counting overload in proximity to the tv set itself was wondering

so currently we have a regular tv ant on the roof of our apt building
plain ol' free OTA broadcast aka analog signal

naturally if i tx near it with anything over 30w (my ant is physically
close to it) i start to get tvi anything from wavey lines to the set
blanking out

now when digitaltv comes out over the air

i wonder, so if i key up as same as above (assuming the dtv was on a
same freq for ex lets say both were using ch 7)

would my signal interfere? or would the dig processor in the set
still be able to get enough signal and then just decode the bits
inference free??

read alot about how immune it should be to tvi, but i wonder

tnx

No, you can still have your microphone but you should be forced to pass
a code test before you're allowed to use it. I like 5 WPM for Tech, 13
for General, and 20wpm for Extra, but then, I'm not lazy.

SC

1359. I remember when there was a sense of pride in passing the 20 wpm CW test.

Please keep in mind that what you post here reflects on all hams.

It is true that ham radio is a fun hobby but keep in mind that we are here to serve the general pubic when ever possible. Be it emergency communication, helping out local law enforcement or what ever.

When a Ham starts posting messages that contains cuss words or are insulting it reflects on the rest of us hams.

We are a self governed entity and for the most part try and help out fellow hams with any questions they may have. (The questions may seem simple even stupid sometimes) but we all have been there at one time.

I would (as most of us would) try and help out someone, rather than insult them. (what possible good can come from insults?)

Many people here have helped me out with my understanding of antennas, and I THANK YOU ALL.

Many of you have vastly more knowledge in the subject than I do and I will ask questions untill I have no more questions to ask.

After all, I can read all the books but untill you ask someone that has BEEN THERE DONE THAT, the books are just a starting point.

I just wanted to thank everyone for all there help and to remind the ones that just FLAME everyone here that maybe they forgot why they got into ham radio ...

Joe
KI4ILB
Solar powered ham radio, when all else fails ...

Heh. Somewhere along the line a long time ago some sage somewhere
stated that there are only two basic types of antennas, point radiators
which are really difficult to build and dipoles and their variants. The
concept stuck and I've been wearing it ever since.

Source record: 50546

The main advantage of a helix is that it "gives" you circular
polarization for "free"...you don't have to phase or split anything.
The disadvantage is generally that they're relatively heavy and they do
require something of a reflector screen behind them, although there are
variants that use a ring reflector similar to what you'd see in a quad
antenna.

Helices have excellent impedance bandwidth, but really the point of
Cebik's article is that the pattern bandwidth is not nearly as large as
the impedance bandwidth. So really it's best to think of them as
single-band antennas like a yagi.

As to sidelobes specifically, you don't really care about that on
transmit for satellite work. But they are important (and to be
avoided) in receive and especially at microwave frequencies. As an
example, in the initial stages of AO-40 (2.4GHz earth receive) many
started with long (5') helices, but quickly realized that small TVRO
dishes were quite superior even though the gain of the two antennas was
about the same.

One great advantage that phased yagis have is that you can switch the
sense of circular polarization--very hard to do that with a helix.
Sometimes satellite links can be improved by switching either your
transmit or receive sense, depending on the relative satellite
orientation and motion.

Actually I was most likely the only ham on the road that night. Even if
I wasn't the truck drivers know the road since they drive it every day
where as very few hams do so. I generally see 100-200 CB equipped
trucks and cars for each ham equipped truck/car. You tell me which
service is better for road conditions?

Ian White (GM3SEK), Cecil Moore (W5DXP), and probably others have
discused HF chokes made from flat vs. bunched coils of coaxial cable,
but I must have missed some posting(s), for I haven't recognized
anything that looks like a CONCLUSION.

* Is "bunched" or "flat" better?
* Are they basically single-band or wide-band or somewhere in-between?
* Are there "rules of thumb" to make them for hams with
* No test equipment?
* A grid-dip meter?
* A noise bridge?
* An antenna analyzer?

OUCH! Oh Lordy, you're absolutely right Richard dammit . . and of all
people I should have immediately thought of a sleeve dipole for my
current HF applications because I built two of the things for 2M years
ago and they worked just dandy. For 2M all I did was grab some RG-58,
removed 19"of the jacket, rolled the exposed shield back 19", laid five
feet of nylon cord alongside the dielectric then sealed the whole
assembly with four feet+ of shrink tubing to seal the whole thing then
added a connector to the feed end and took 'em to the airwaves. I could
hang them anywhere via the nylon cord to get on 2M. Or I could roll
them up and stuff them into the glove compartment No tuning networks

required and the power handling capability was limited by the melting
point of the dieleleric or the jacket.

I can easily build similar antennas for the HF bands and maybe I will.
But not right now.

Write this blooper off to my raging Halfheimers . .

OK, OK . . jeez . . in my case they're half wave verticals, they're
single-band half wave monopoles, they're half wave vertical dipoles,
call 'em half-wave vertical washing machines for all I care about
splitting semantics hairs at this level all of 'em take up very little
horizontal space which is what's scarce here, instead they take up
"vertical space" which I have in abundance and will put to work

Oy vey . . ! Calm down Richard and connect with reality willya?. The End Fedz line is a collection of catalog easy-up antennas with well-defined limitations offered for sale to those who can make use of them for their specific interests and operating objectives. Is there anything wrong with that? Of course not. Even at their worst they're still not snake oil antennas like G5RVs which often cost fifty bucks or thereabouts too.

Hi Myron,

One conclusion is that there is an optimal solution, a special solution, and a general solution, but it is more a problem of what was the "ultimate question?"

In short, one size does not fit all and you need to define your requirement to best obtain the right answer.

This is probably why the beaded ferrite choke is so popular. It might not present 10KOhms of Z, but it doesn't have to, to be useful and it is useful for a considerable stretch of spectrum.

this did help me interpert the article a bit more, i was on track at
least :) really appreciate both of your help!!

for 2m most of the antennas i've looked at such as the m2 it seems i
am liking best, is a bit too long and was hoping to find a simular
but shorter antenna as it's a typical beam perhaps i can just chop
a bit off the ends' the helical's i've seen were all a bit
physically boom wise shorter but i guess not worth it performance wise

There's got to be a history of the word dipole still in
existence. If you look at the Wikipedia definition of
"dipole", it refers to the equal and opposite charges
existing at two points, akin to the equal and opposite
charges existing at a point in time at the two ends of
a 1/2WL piece of wire. Your 1/2WL continuous piece of
conductor has two electromagnetic poles somewhat akin
to the earth having two magnetic poles. I suspect it was
ignorant hams who changed the meaning to two conductive
fishin' poles pointed in opposite directions and fed in
the middle. :-)

Ian and I agree that the ARRL was overly optimistic when
they asserted that a coiled coax choke can cover all three
octaves of HF.

The requirements for a choke feeding an
all-HF-band, ladder-line fed dipole are much higher than
the requirements for a choke feeding a resonant fan dipole.

> * Is "bunched" or "flat" better?

Bunching disadvantage: Lowers the maximum choking impedance
and decreases the effective bandwidth. (Bunching increases
the stray capacitance.)

Bunching advantage?: Lowers the parallel self-resonant frequency
so not as many turns are required for narrow-band operation.

> * Are they basically single-band or wide-band or somewhere in-between?

Depends upon the minimum required choking impedance. A 2:1 to
3:1 frequency range might be a good rule of thumb, e.g. one
choke can cover a tribander's 2:1 frequency range.

> * Are there "rules of thumb" to make them for hams with
> * No test equipment?
> * A grid-dip meter?
> * A noise bridge?
> * An antenna analyzer?

How about: Using a 2L pop bottle as the coil form, don't use
more turns than the number of meters in a wavelength, e.g. no
more than 10 turns on 10 meters? That would probably work for
20m-6m as a rule of thumb.

The MFJ-259B will measure impedance up to 650 ohms. One could
define a "bandwidth" based on that 650 ohm value and knowledge
of a typical impedance waveform between those two points. For
instance, my 8 turn, 5.35" diameter choke falls below 650 ohms
at 4.63 MHz and 28.1 MHz. It might be useful over a 3:1 frequency
range from 40m-15m.

Conclusions! You want WHAT??

You have recognized a GREAT TRUTH about this group. There NEVER is a conclusion! Oh, there are subthreads, red herring threads, three month continuous running threads, insulting threads, I am better than you are threads, even threads that remain close to the original subject.

But, there is NEVER a concluding post to a thread.

Sorry, my Internet access is down at the moment, so there's no knowing when this will get out.

>Ian and I agree

... about quite a lot actually :-)

>that the ARRL was overly optimistic when
>they asserted that a coiled coax choke can cover all three
>octaves of HF.
>
Agreed. That claim is made in the general ARRL Handbook. The ARRL Antenna Book gives more detail, but notably does not include that claim.

>The requirements for a choke feeding an
>all-HF-band, ladder-line fed dipole are much higher than
>the requirements for a choke feeding a resonant fan dipole.
>
>> * Is "bunched" or "flat" better?

"Bunched" and "flat" both mean the same to me - the cable is wound into a flat coil like a length of rope. The actual choice is between that shape and a cylindrical solenoid shape.

>
>Bunching disadvantage: Lowers the maximum choking impedance
>and decreases the effective bandwidth. (Bunching increases
>the stray capacitance.)
>
>Bunching advantage?: Lowers the parallel self-resonant frequency
>so not as many turns are required for narrow-band operation.

The bunched/flat shape has more self-capacitance between turns, so for the same total length of cable it has a lower self-resonant frequency. The bandwidth of either shape is wide enough to cover any amateur band with a very high impedance - way higher than you could get with a ferrite choke - but you do need to get the resonant frequency right.

>
>> * Are they basically single-band or wide-band or somewhere in-between?
>
>Depends upon the minimum required choking impedance.

A resonant coiled-cable choke is unbeatable on a single band, but you
may not actually *need* a choking impedance of several kohms.

If you only need an impedance of a few hundred ohms (though more is
always OK of course) then I'd agree with Cecil:
.
>A 2:1 to
>3:1 frequency range might be a good rule of thumb, e.g. one
>choke can cover a tribander's 2:1 frequency range.
>
That seems realistic for either the bunched/flat or the solenoid shape.

>range from 40m-15m.

You could certainly try Cecil's suggestions, though the resonant
frequency can be quite critical if you want to spread the performance
across more than one band.

A GDO should be OK for measuring the resonant frequency, with the two
ends of the choke shorted together.

However, maybe we're all trying to measure the wrong thing. The reason
why we're using these chokes is to reduce the unwanted common-mode
current, so why not cut to the chase, and measure the current itself?

Whoever you are, if you don't already have a snap-on RF current meter,
then make it your next homebrew project or ham radio purchase. It is THE
most useful single tool for RFI investigations, so it's always good to
have one in the shack.

In this particular application, you could measure the common-mode
current on the TX side of the choke - the answer is there "in a snap".
Then you can either declare the problem solved, or follow the meter

readings as you adjust the choke to reduce the current even further.

There are details of HB meters on my website, or the MFJ-854 is a good commercial alternative (but definitely not the MFJ-805).

Then why don't they?

>The divisiveness stems from the fact that too many no-coders
>appear to want to change the requirements with no knowledge, experience, or
>understanding of the requirements.

Nonsense. Pro-coders do NOT have some "lock" on What The
Requirements Should Be. They never did, despite all the
pro-code propaganda drilled into your respective psyches.

It should be quite obvious that every other radio service
has either given up on using morse code for communications

or never considered it in the first place. Manual radio-telegraphy has only a slight advantage in communications with other amateurs using radiotelegraphy who do not speak English.

Note: Nowhere in the "requirements" (Title 47 C.F.R. Part 97 for US radio amateurs) is it mandatory for US amateurs to communicate with foreigners. NB: Non-English speakers using International Morse Code are, essentially, required to learn parts of English to understand the English alphabet (difficult if their native language is syllabic or has a different alphabet).

The ITU-R "requirements" (Radio Regulations) no longer "require" administrations to test ALL their amateurs for any license having below-30-MHz privileges. The major (in population) nation administrations have dropped their morse code testing or substitute other tests in lieu of morse code. Since some of those nations do not have English as a primary language, those will have some future difficulty using that (supposed "universal language" of morse code) for communications with USA radio amateurs.

>In addition, most of us have experienced
>people who said they could not learn code but upon questioning find that
>they did not use a good training method and did not train correctly.

More overtly biased opinion...written AS IF morse code were an "absolute requirement" when it is merely an old regulatory hanger-on in USA amateur federal rules.

The REGULATION (not "the requirement") for US radio amateurs is simply a man-made regulation which can be un-man-made. It is not some God-given commandment of radio. Indeed, all other US radio services operating below 30 MHz do NOT use morse code radiotelegraphy. Why should radio amateurs be held elevated to some special significance?

Except for the older military-trained radiotelegraphers in US amateur radio, all the tales told (by so-called successful pro-coders) have them doing basic learning then trying out on the amateur radio bands for greater skill in radiotelegraphy.

The basic fallacy of pro-coder thinking is that "all" have some innate ability to learn morse code. That has been disproven as far back as World War II when the US military began screening new recruits for the aptitude to learn morse code. That fallacy has been disproven by countless other tales of individuals who tried the so-called "good training methods" and tried to "train

correctly" (even under strict supervision).

>Yet
>when they decided they were tired of waiting did learn it and got their
>upgrade.

The "upgrade requirements" were lobbied for to emphasize
morse code radiotelegraphy skill. That is history. It
would have been difficult to overcome the lobbying of the
ARRL towards such "upgrades through morsemanship." Yet
there has been efforts by concerned radio amateurs (who
have been tested to the maximum telegraphic radtes) to
eliminate the morse code test entire. That is not some
strict USA effort since the ITU did change international
amateur Radio Regulations in 2003...under pressure from
the IARU. Your sentence is written with an obvious
pro-coder bias.

>Then finding out how useful it was in ham pursuits were glad that
>they had done it.

Another fallacy and another pro-coder bias statement. It is
obvious that many, many US radio amateurs were NOT favorites
of morse radiotelegraphy and never used it after they received
their first license.

>So far of each of the reasons that people put forth as to why they can't
>learn it have been disproven by the example of other people with the same
>problem having gone ahead and done it.

Yet another fallacy and a repetition of the earlier fallacy
that all US human beings are somehow able to learn morse
code...provided they have some (mysterious) "attitude"
adjustment in favor of radiotelegraphy as an "absolute"
requirement in radio?

>The 5wpm level is obtainable
>although some of the problem do make faster speeds a problem (constant
>tinnitus may be a severe problem at 20 wpm for example).

Then they should use "flashing lights or vibrating pads."

The reduction to 5 WPM equivalent word rate was an attempt
of the FCC to satisfy both the pro-morse-code-test citizens
and the (ever-growing) NO-code-test advocates. It satisfied
neither.

>My ex-OM had 70%
>hearing loss in both ears and severe tinnitus. He passed the 5wpm.

It would seem that one of you (perhaps both) at lost the
ability to understand the "I do" at your marriage ceremony?

Did your "EX" pass using flashing lights or vibrating pads?

>I know people with dyslexia who have passed.

I knew people with terminal cancer who "passed." [just not
the code test]

I "know people" ranging from PhD aerospace gurus to never-
make-star-quality bimbo actresses and thousands of shades
of personal abilities in between. I know few dyslexics.

>The blind have passed.

I am acquainted with several blind people through the
Braille Institute. None of them had any desire to learn
morse code. They were thankful enough to be able to get
around by themselves and be reasonably productive in life.

>Even the deaf have passed using flashing lights or vibrating pads.

In the year that Ham Radio magazine sold out to CQ, I
interviewed 11 licensed radio amateurs preparing an article
for that magazine. ALL of them passed their code tests
for amateur radio licenses when they could still hear.
None of them "passed using flashing lights or vibrating
pads." All were male. One was a practicing dentist.

>Do you have competitions in your model railroading activity? If you enter
>that competition, you all have to follow the published rules with no
>exceptions.

Part 97, Title 47 C.F.R. does NOT manadate that US radio
amateurs engage in "competition" radio activity.
Federal law (Communications Act of 1934 plus the Tele-
communications Act of 1996) requires ALL US radio
amateurs to follow its regulations. That is NO contest
nor a "competition" activity. It is merely the LAW.

As with all US federal agencies, the FCC does accept
citizen commentary to them regarding radio regulations.
The FCC responds to Petitions submitted by US citizens
in regards to those radio regulations. [however, not
with blinding speeds of decision in regards to amateur
radio] Nowhere does the FCC discriminate between those
are already licensed in amateur radio versus those not
licensed. FCC does not treat the group of already-
licensed as some kind of fraternal order of the already-
licensed to be listened to over and above all other
interested citizens.

The morse code test (for under-30-MHz operating privileges)
affects the non-licensed US citizens. It does NOT affect
those already legally licensed as radio amateurs...except
in the limited conditions of certain already-licensed
Technician classes. That code test does NOT legally
affect ANY other already-licensed US radio amateur. If

they say it does then they have some emotional disturbance (not a legal problem nor a regulatory problem).

I know a few model railroaders. As far as I know none are into "competitions" concerning their hobby. They do it for the fun of model railroading. As a hobby, not as a substitute for life...nor advancing the state of the art in rail transport.

I know many more model builders and model aircraft flyers. [I have been both] The Academy of Model Aeronautics (AMA) is a membership organization (about a quarter million members in the USA) with a large rule set to follow in flying model aircraft. That rule set is for both competition flying and for safety; there is special liability insurance for members of the AMA in regards to that flying activity. There is no absolute requirement to be an AMA member to enjoy model airplane flying nor is there some federal test one must take to be one. It is a hobby...yet the AMA has successfully petitioned for and gotten many radio channels expressly for model remote control. No code test nor license was required. You may read about it in Part 95, Title 47 C.F.R. under Radio Control Radio Service.

"Park flyers" are free to fly models, even to radio-control them, all without being licensed by the FCC or as a member of the Academy of Model Aeronautics. Add to that the R-C cars and boats. There is a very large model hobby industry existing in the USA to provide for such hobbyists. From the size of that industry the number of modelers would easily equal the number of USA radio amateurs...if not exceeding it.

Your comments in regards to "competitiveness" do not apply to US citizens seeking to change existing radio regulations in the USA, any radio service.

LenAnderson@ieee.org

1391. Timewave ANC-4 question!

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-25 16:22:19 UTC
From: Sun Tzu <Sun_Tzu@war_what_does_it_mean.org>
Message-ID: <_rCdndMY26mGEqLYnZ2dnUVZ_oOdnZ2d@hawaiiantel.net>
Source record: 50564

I use an Timewave ANC-4 to reduce noise on the low bands at my location.
On 40 & 160 meters I can reduce the noise almost to S1, but on 75 meters I
can only reduce it to S4-5.
I use a noise sense antenna which is a dipole 4ft on each side about 4
inches off the ground and parallel to the power and telephone lines.
Anyone have one of these units and having any ideas I might try to reduce 75
meters to a lower S-meter reading?

All my low band antennas are verticals.

Actually there was enough information to conclude if you want an all hf band 1:1 balun, abandoning the coiled coax and using ferrite may be the way to go.

Wow, what a run on sentence!

I have helped cut wood for winter heating. I have also foraged for berries, actually Granny knew where to look and took me along to help pick berries. I have never hand cranked a model T, but have watched others do it (was tied up with winter wood cutting, the "T" drove a belt with a rear axle wheel to drive a large circular saw) I never did any of the other things listed, but if Granny were still here, I'd bet she has and could describe the process. Except the spear hunting, that was before Grannys time and on the other side of the family.

Lurkers may get the impression that we disagree a lot. :-)
Most of us technical types agree on 99 and 44/100% of
technical topics. We often argue about which favorite
approach is better when they are equally effective.

I just plotted the impedance of a lumped inductor in
parallel with a lumped capacitor, the impedance based
on a transmission line analysis, and the impedance
actually measured. The three graphs overlaid each other
until approaching the series resonant point where the
transmission line analysis more closely matched the
measured results. In particular, the actual measured
value was around +j258, the transmission line value was
around +j135, and the lumped circuit value was around
-j570.

> "Bunched" and "flat" both mean the same to me - the cable is wound into

I don't think that's true, Ian. There are three ways to
wind a choke. 1. helical, 2. spiral, 3. random I'm pretty
sure "bunched" means "random" and *not* flat. Maybe that
is the origin of our disagreement over "bunched". If the
bunched coil was really random scatter winding, would you
like it as much?

> There are details of HB meters on my website, or the MFJ-854 is a good

>
> Wow, what a run on sentence!

Which sentence? Mine is totally grammatically correct.

A real run on sentence will be found if you study the serious works of some Jesuit Priests. When I was in seminary I had to read/study some Jesuit theology texts. The first sentence took three pages. One chapter took an 8 hour flight from Boston to LA. And, I still didn't finish :-(

But, they were grammatically correct ... Does that mean your sentence is too short? :-)

Now, hopefully to conclude this thread [well maybe] I agree that a broadband ferrite balun is the way to go for typical HF.

Mine seems to work fine with about 25 feet of wire simply run out the window and about 4 inches above the ground along the foundation of the house.

[End fed random wire approach]

Sorry, maybe there's language barrier here. Imagine coiling a rope in your hand like a cowboy, then laying the coil on the ground. I meant a "flat" coil in that sense, as opposed to the other way of winding these chokes on a cylindrical former.

>> There are details of HB meters on my website, or the MFJ-854 is a

>I've got the MFJ-853. It snaps but doesn't unsnap. :-(

The 854 that I reviewed for Radcom was the same. We both got one that had the core assembled upside-down, so instead of showing you how to snap the plastic catch open, the instruction manual shows you how to break it.

I not only learned to drive on a 1924 Model T, I also cranked it, because that model didn't have an electric starter. The first car I owned was a 1927 Chev.

I grew up with indoor plumbing, but both my maternal and fraternal grandparents lived nearby, maternal 1 mile and fraternal 3 miles. Whenever visiting them, which was often, I had to use the three-holer with paper from the Sears Roebuck catalog.

Hi Ian,

Really? 3 to 30 MHz is more than three octaves:
3 - 6 - 12 - 24 + 1/3 octave more

Are we talking about Ham Bands?
160 - 80 - 40 - 20 - 10

Are we restricting from the top of the 80M band through 10M?
4 - 8 - 16 - 32 (actually 88% octave more)

From 60M up?
60 - 30 - 15 + 75% octave more

A subset of HF? such as
160 - 80 - 40
80 - 40 - 20
40 - 20 - 10

To anyone,

Just where did the ARRL come up with this new band plan for HF?

Hi Myron,

Can you see any conclusion yet? Even with the new 3 Octave
specification you still have to pick your application from 3 choices.

A lot of arguments are over semantics. Again, there are
three ways of winding the chokes; helical, flat spiral,
and bunched like a cowboy rope. The flat spiral is also
known as a "pancake" choke or coil.

3 is not in the ham bands. 3.6 - 7.2 - 14.4 - 28.8
There's the three octaves the ARRL was talking about.

I understand enough to know that thousands have passed the code elements,
but now that it looks like ham radio is going to get dumbed down more you
refuse to be a good ham and learn it.

Right, and why homebrew anymore when you can call HRO or AES and buy your
appliance off the shelf.

73,
Back to my CW and projects.

Everytime you try to offer help to a no-coder or nickle ham, they put
you in a killfile. I don't think they want to improve.

Ham radio is better. With CB you can only go out about fifteen miles, but
with ham you can get road conditions three states away. Of course, with
all the no-codes and nickle amateurs on ham radio these days the road
reports aren't as good as they used to be.

1430. fuel cell battery buffer or cap?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-26 00:22:01 UTC
From: ml <m@di.net>
Message-ID: <m-298884.20220325102006@news.verizon.net>
Source record: 50503

hi

was wondering if someone had some thoughts on this and might be able to help me 'calculate' the value i need

I was thinking of getting a jado fuel cell, it puts out 100w (about 8amps ?) @12vdc

it's not totally regulated, at full output the volts dip a bit

wanted to power a 2m rig at low power 5w out it falls w/in the spec's of the jado but i wanted a buffer

at first i thought of a battery using the full cell to charge the battery during receive since tx is brief but how do i calculate how big a battery i need?

i also wondering if perhaps a capacitor or a few of them might also do the trick and if so how to size them

not sure the pro's /cons' of battery vs cap's

naturally if i used the caps' i'd prob get a dc to dc regulator

any help appreciated

More likely a knee jerk reaction to the very few but very vocal ones who try to come in and act like they know all there is to know about radio when the "ink isn't even dry on their license". It's unfortunate that the experienced hams don't have the discipline to withstand this nonsense without such knee-jerk reactions.

When a new licensee (the level of license is irrelevant) tells me that you can't work DX without an amplifier, I just tell him about the countries I worked with my 100 watt radio and relatively low mount G5RV. But some hams turn bitter instead when a newbie insists that he is right and they are wrong.

Stick code up your lame old ass. No one cares about code, let alone
hams, shortwave, etc. Get a fucking life. No one here wants to hear
about your dead code bullshit.

Hi Myles,

Fuel Cell??? That is a pretty pricey option.

More than likely it is 100WH (Watt-hour, not Watt) rated.

>wanted to power a 2m rig at low power 5w out it falls w/in the spec's
>of the jado but i wanted a buffer

Well, a 5W transmitter is not going to load it too heavily, but you
have to figure that 5W out is a 10W demand on the battery. This means
your battery will work 8 - 10 Hours continuous (you don't sit on the
key, do you?).

>at first i thought of a battery using the full cell to charge the
>battery during receive since tx is brief but how do i calculate

A battery - fuel cell - battery?

>how big a battery i need?

At least 100WH, undoubtedly more.

Why charge a fuel cell with a battery? Why not cut out the middle man
and just run battery operation?

>i also wondering if perhaps a capacitor or a few of them might also
>do the trick and if so how to size them

Not unless you can assemble a couple hundred Farads (note the complete
absence of pico, nano, or micro in that Farads). The short version is
DON'T GO THERE.

I would use a small gel cell across the 12V output. I do have some worries since it says "nominal" 12V output and no better information than that seems to be available on the site.

Except the prices. You must be quite well off to consider purchasing this, since the XRT is $7999 and does not include a refill station at $599 or $1799, so once your canisters are empty you are done.

If you can afford this system, I would suggest you buy a nice top end deep cycle battery, $300 for 80 AH is in the correct range.

Or you could just burn gasoline in a 2000W Honda which costs about $1000, makes almost no noise, is quite light, and will generate less CO2 than the fuel cell system will when you get down to reality since the fuel cell system is actually powered by the fairly inefficient electrical grid. And it will cost a ton less as well as delivering 20

times the peak power with commonly available fuel.

Hi Dave,

I am notorious for my poor grammar and run on sentence creation. It was
a knee jerk reaction of mine to point out my poor grammar before someone

else does.

But three pages! Wow that beats any sentence I could come up with.

Regards,

Chris

My 115 amp hour deep cycle trolling battery only
cost about $70 at Sam's Club.

You need to do some reading. Try "Conclusions for Dummies", along with
Feynman's "Special Relativity and the Dipole" and possibly also "String
Theory and Its Applications to Near Field Anomalies". After that, you
have my permission to post in this NG.
:)

BTW, the 1000W EU1000i model will deliver 1000W at 3.8 gallons per day, and 250W at 1.7 gallons per day. The unit is listed at 790 USD. There are simple modifications to use a boat gas tank (usually about 6 gallons) with this unit which would make the run time 3 days for most emergency amateur use before refill. I would take this as a first responder system in a heartbeat.

I also wonder where one would get the energy to refill the hydrogen for the fuel cell unit when in a place like New Orleans after Katrina. Gasoline would still need to be hauled in, and would probably be more efficiently used providing power directly from a smart generator than splitting water to make hydrogen which would then be used in a fuel cell.

If all you really need is 5W out I would spend my money on about 5 amps of solar cells at 12 volts nominal, a really good charge controller such as this one - http://store.solar-electric.com/sbchco2512vm.html - and a good 200 or 300 AH deep cycle, you would be well ahead of the fuel cell solution. And it would keep you in energy for a lot of dim days.

How did you manage to find this arrangement? trial & error? by accident?
I keep trying different things but maybe I am "thinking" too much, maybe its simpler than what I am trying to do.

Anyone know what Cushcraft uses in their 2 meter and similar antennas to secure the lower end into their base? It "appears" to be a white substance. Lots of hot melt glue?

The substance gave way on an antenna I have here and I'd like to repair it.

Thanks!

thanks to all that replyed\
Tom , you changed my equation, combustion generators and solar are not options or the question, it was a rather obvious choice but thanks <not sure where everyone got their spec's from and pricing but your numbers are off and most likely i'd get a sample unit free , tom i also wouldn't be using it's charging canisters but sstraight into the tank

the jado i mentioned list price is around 2k$$ and i can get it for less list and it is 100w it lit my 75w light bulb pretty steady and bright

Question:
i thought since my key down isn't steady that might be enough juice to then charge top off'' the battery but i didn't know how to size it

i'd have x amps (or ah) from fuel cell x ammount of draw think my rig pulls 5amps? tx, x ammount capacity from batt,, so after say a min of key down the battery would be y drained, given a big enough battery Y (drain)would need to be small enough such that the 12/8amps out of the Jado fuel cell would be able /fast enough to top it back off

question is what is that value how do i calculate how big a battery i need at the know constants?

Rich the reason i thought of cap's was both the short key down time and the article in cq of this new powersupply that uses a few 5farads it got me thinking if it could be modified to do dc to dc regulation rather than 120v ....maybe i was pushing it, then i thought of supercapacitors i dunno

No such "propaganda", Len.

> It should be quite obvious that every other radio service

Why is that important to *amateur radio* policy, Len? Amateurs *do* use
Morse Code - extensively.

> Manual radio-
> telegraphy has only a slight advantage in communications

> English.

Actually, Morse Code has a lot of advantages.

> Note: Nowhere in the "requirements" (Title 47 C.F.R. Part

> to communicate with foreigners.

That's true. But one of the Basis and Purposes of the Amateur Radio
Service is international good will. Communicating with "foreigners" is
one way to do that.

> NB: Non-English speakers
> using International Morse Code are, essentially, required

Yep. That changed almost 3-1/2 years ago. Yet FCC has not acted upon
it.

> The major
> (in population) nation administrations have dropped their
> morse code testing or substitute other tests in lieu of
> morse code.

How do you know?

Have China, India and the countries making up the former Soviet Union
changed their Morse Code test policy? How about Japan?

Seems to me that the changes have mostly occurred in Western Europe,
the British Commonwealth, and a few South American countries.

> Since some of those nations do not have

It's a fact that at least some people use poorly-designed training
methods.

> The REGULATION (not "the requirement") for US radio
> amateurs is simply a man-made regulation which can be
> un-man-made. It is not some God-given commandment of

That's true. In fact, *all* radio license requirements are man-made.

> Indeed, all other US radio services operating
> below 30 MHz do NOT use morse code radiotelegraphy.

Why is that so important? Do you think radio amateurs should not use it

> Why should radio amateurs be held elevated to some
> special significance?

It's not about 'special significance".

Radio amateurs *do* use Morse Code, so it makes sense to test for
knowledge of it.
>
> Except for the older military-trained radiotelegraphers
> in US amateur radio, all the tales told (by so-called
> successful pro-coders) have them doing basic learning
> then trying out on the amateur radio bands for greater
> skill in radiotelegraphy.

What's wrong with that?

> The basic fallacy of pro-coder thinking is that "all"
> have some innate ability to learn morse code.

There are obviously those who cannot learn it - just as there are those
who cannot learn to speak, or read and write, or who cannot pass the
written tests.

> That has
> been disproven as far back as World War II when the US
> military began screening new recruits for the aptitude
> to learn morse code.

Nope.

The military aptitude testing was done to find those who could learn
the fastest and reach the highest levels of skill in the least time.
The requirements for military radio telegraphers were much higher than
for amateurs, and the military could not afford lots of time to train
them.

btw, the existence of such aptitude testing proves that the US military
needed large numbers of Morse Code skilled radio operators during WW2.

> That fallacy has been disproven
> by countless other tales of individuals who tried the
> so-called "good training methods" and tried to "train

Who are they, Len?

> >Yet
> >when they decided they were tired of waiting did learn it and got their
> >upgrade.
>

> The "upgrade requirements" were lobbied for to emphasize
> morse code radiotelegraphy skill. That is history.

Who lobbied for those requirements, Len?

When did they lobby for the requirements?

The fact is that in all the history of US amateur radio licensing,
every increase in Morse Code testing has been accompanied by an
increase in written test requirements. So the emphasis has always been
balanced between written testing and Morse Code testing.

Since 1990 it has not been necessary for anyone with a doctor's note
seeking an FCC-issued amateur license to go beyond the basic 5 wpm
test. Since 2000 it has not been necessary for anyone seeking an
FCC-issued amateur license to go beyond the basic 5 wpm test.

> It
> would have been difficult to overcome the lobbying of the

The FCC accepts comments from everyone - not just citizens.
"Foreigners" and groups/corporations are welcome to comment as well.

How much consideration the comments get is another matter.

> The morse code test (for under-30-MHz operating privileges)
> affects the non-licensed US citizens.

And those licensed, too. And noncitizens.

> It does NOT affect
> those already legally licensed as radio amateurs...except
> in the limited conditions of certain already-licensed
> Technician classes. That code test does NOT legally
> affect ANY other already-licensed US radio amateur.

It affects them in many ways. If amateur radio should change for the
worse because
of changes in license requirements, those who are already licensed
would be affected.

For example, if someone wanted to change the real estate zoning in your
neighborhood,
that change would not "legally affect" you or your neighbors, unless
you wanted to build on your property. Your houses would not change.

> If
> they say it does then they have some emotional disturbance
> (not a legal problem nor a regulatory problem).

Not true. If amateur radio is made worse by rules changes, all involved
are affected. You, who are not involved, are unaffected.

If someone wanted to change the real estate zoning in your
neighborhood,
that change would not "legally affect" you or your neighbors, unless
you wanted to build on your property. Your houses would not change.
Would you say that those who resisted such a zoning change have an
"emotional disturbance"?

> I know a few model railroaders. As far as I know none
> are into "competitions" concerning their hobby. They do
> it for the fun of model railroading. As a hobby, not
> as a substitute for life...nor advancing the state of
> the art in rail transport.

Model railroading does not involve any sort of licensing, nor use of
the radio spectrum. What one model railroader does with his/her layout
does not directly affect what other model railroaders can do with
theirs.

Amateur radio isn't like that. We use a shared and limited resource -
the radio spectrum.

A more valid analogy would be something like operating motor vehicles
for noncommercial purposes, where the medium (the roads) are shared
with many others.

> I know many more model builders and model aircraft flyers.

> to be an AMA member to enjoy model airplane flying nor is
> there some federal test one must take to be one. It is a
> hobby...yet the AMA has successfully petitioned for and
> gotten many radio channels expressly for model remote
> control.

How many channels? How much total spectrum? How much of it is below 30
MHz?

IIRC, the total amount of spectrum set aside for model control is less
than the narrowest amateur band above 30 MHz.

btw, there has been no Morse Code test requirement in the US for use of
all the amateur bands above 30 MHz.

> No code test nor license was required. You may
> read about it in Part 95, Title 47 C.F.R. under Radio
> Control Radio Service.

They got a few channels in a few narrow slices of VHF/UHF. They are
allowed to use only very low power, with almost all their
communications limited to line-of-sight.

Amateur radio is very different.

> "Park flyers" are free to fly models, even to radio-control
> them, all without being licensed by the FCC or as a member
> of the Academy of Model Aeronautics. Add to that the R-C
> cars and boats. There is a very large model hobby industry

> existing in the USA to provide for such hobbyists. From
> the size of that industry the number of modelers would
> easily equal the number of USA radio amateurs...if not
> exceeding it.

Yet all they need is a small assortment of VHF/UHF channels, low power, small antennas and line-of-sight radio.

Is that what you think amateur radio should be?

It should be remembered that one of the primary reasons model aircraft enthusiasts got channels in the ~70 MHz range was the fact that their 27 MHz allocation became unusable due to being effectively taken over by illegal cb operation.
>
> Your comments in regards to "competitiveness" do not apply
> to US citizens seeking to change existing radio regulations
> in the USA, any radio service.

FCC does not limit comments to only US citizens.

And when FCC recently asked for comments on the Morse Code test issue, the majority of those commenting were *against* the complete elimination of the Morse Code test. The ratio was approximately 55% in favor of at least some Morse Code testing.

Lots of hams use vertical coaxial-sleeve dipoles
with the coax feedline running up through the sleeve.
Lots of hams prefer end-fed antennas. Does anyone run
his coaxial-sleeve dipole horizontally?

Douche, Actually a lot of people do care about CW. There is frequently a lot of CW activity on the various bands. CW has been my primary operating mode for the past few years. I have not been at it for 100 years and I am a hardcore computer geek. CW is just a pleasant change of pace for me. However, I must agree with you that some of the putzes on this group do need to get a life -- there actually is more to life (and ham radio) than CW. If it were not for my growing killfile, the QRM here would be deafening.

I got the pricing from jadoo's site for the unit plus 6 container combo.
And you will still need something to refill.

On the battery, when we used to VHF contest with a light (600W)
generator and power supplies, we would put a 25AH battery across each 15
amp supply and we could draw 40 or 50 amps on CW/SSB peaks with no
issues. So you would probably be well served by one of the 7AH UPS
batteries from a place such as Batteries Plus. They cost about $25 and
are about 7"Lx2"Wx4"H.

When I operate on 75 meter SSB with my transceiver, my computer beeps and disconnects/reconnects my USB connected keyboard. Note that I do not have this problem on 40 meter SSB. My computer is located on the second floor of a brick house, and one end of my dipole is about 15 feet from my shack.

From comments made by others, I may have to put RF filters on the cables and wires connected to my computer. I am contemplating the use of Amidon FT-240-77 ferrite toroids, which have an I.D. of 1.4 inches and cost $9 each. If I buy in quantities of 10, is there a cheaper source for this toroid?

Any comments or suggestions on this problem would be appreciated.

Try Snap-on-choke, I think Radio shmack stil carries them.
They are two U shaped ferite pieces with plastic clamp. (Or split core cylindrical ferite cores as seen on some keyboard or USB cables.)
You open them up, wing the wire or cord around the "legs" and close it. Put it close to the computer case. It shouyld clear the problem.
You might wanna try which cable is most "antenna" and picking up RF>

Good advice Yuri...
But, I think the first thing he needs to do is get some aluminum roof flashing from Home Depot and cover the top of the operating bench with it and set the equipment on the flashing... Ground every piece of gear to the flashing with short connections... THen hang a quarter wave of wire off the flashing (68 feet for 80/75) - which becomes an RF counterpoise, and route it down the hall, or out a wind0w, anywhere to get the far end as far away as possible from the computer and the 110/220 electrical wiring in that room...
Another trick is to use a small antenna tuner as the ground radial tuner - I prefer simply cutting the RF counterpoise to a quarter wave, cheaper too...
The next thing is to get the Logic Tech wireless keyboard and mouse...

>need at the know constants?

Hi Myles,

It is a matter of three things:
1. Amp-Hour or Watt-Hour capacity;
2. Demand for Amps or Watts;
3. Duty ratio.

Based on your specification for a 5W rig (I assume it is a hand held, a small mobile would be more like 20-35W) and an efficiency during transmit of 50-70%, then your demand would be at least 10W during transmit. Receive would require some baseline power, my guess would be 2W, maybe less. If you listen more than you talk by a factor of 5, then you could count on an average demand of 2W.

Divide this 2W into the Watt-Hour capacity (I will assume 100WH) and your power source should last two days continuous use (do you plan on sleeping?) or 50 hours of on time over any more extended period. That is, if you sleep 12 hours, you can stretch the service time out to 4 days. If you operate only 2 hours a day, you can stretch the service time out over a month an a half.

Thanks for the URL. There are a couple of points to make.

When I suggested that 40 turns might be required for 75m,
I was chastised for my statement. Note that the above URL
contains data on a 38 turn choke on a 4.5" coil form for
75m operation. The choking impedance is 1300 ohms on 75m.
Parallel self-resonance on 75m would require more turns
than 38.

Much of the "Ugly Balun" information should be ignored. It
is not possible for an ugly balun to be "effective" from
1.8 MHz to 30 MHz. Note there are no impedance measurements
to back up the ugly balun's claim of being "effective" over
that frequency range.

Hi Bob,

That question is apocryphal. I remember installing Windows 3 and
having one hell of a time getting the mouse to work. I called the M$
help line and they marched me through the complete install.

They pondered my problems and finally asked:
"What mouse I are you using?"
Me:
"A Microsoft mouse."
The voice of the blue screen:
"Microsoft mice are not compatible with Windows."

There was an object lesson there I will never forget.

So apparently your correspondent was correct after all.

> WOW! Infinite Watt Hours. I think we can walk away from the mid-east
> right now.

No, actually when you take time to understand the literature (like Myles evidently has), it becomes quite clear that the limit to the rate at which energy can be extracted from the power unit is 100 watts, and that the total amount of energy which can be extracted is determined by the capacity of the fuel cannister; either 130 watt-hours or 360 watt-hours.

So it seems that if you want to be able to rely on this power source for any extended length of time, 5 watts would not be an unreasonable load. I'll wager it would even count for 100 extra points at Field Day - albeit at a cost of $15-$20 a point.

Dee, the "ink on my license" has been "dry" for 50 years.

The mimeograph "ink" on my Army assignment has been "dry"
for 53 years.

The "ink" on my first aerospace hiring has also been "dry"
for 50 years.

In a half century of being radio-active, I've continually
been learning, working, experimenting, trying, doing. I
DO know a fair amount of things about radio and electronics
but there is always something new coming up all the time.

OH! You mean AMATEUR RADIO "license?" Of course. Amateur
radio is so very DIFFERENT than all other kinds of radio...

Riiiight...those coming into ham radio from any other kind
of radio service(s) are "newbies" and "ignorant"...?

Heil thinks so. Do you think so?

>It's unfortunate that the
>experienced hams don't have the discipline to withstand this nonsense

I'm trying to figure out how I can make more effective
measurements on coiled coax chokes with the equipment
that I presently have. I can measure the impedance with
my MFJ-259B if it is less than 650 ohms.

I also have a GDO. If I get an open circuit dip, would
that be the parallel resonant frequency? If I get a
short circuit dip, would that be the series resonant
frequency?

I also have a dual-trace 100 MHz Leader o'scope. I
should be able to find the resonant frequencies
by watching the voltage drop across a series resistor.
I also have the X-Y feature so I could look at the
source voltage, voltage across the choke, and voltage
across the resistor as the frequency is changed.

What do you think?

> 73, Cecil http://www.w5dxp.com

Those antennas have poor decoupling from the feedline,
unless you use decoupling devices of some type. I once
made one of those for 2m. In general, it was horrible when
using it with no decoupling. If I run a vertical half wave, I
actually prefer to base feed it, if I'm going to run it with no
additional decoupling sections. I would never end feed a
horizontal wire antenna unless it was a last resort. If I did,
I probably wouldn't even bother with trying to center feed
it like the coax sleeve antenna.
A vertical coax sleeve antenna needs cones, radials, chokes,
etc at the proper points on the feedline. Usually two sections
if you want good decoupling. The sleeves are probably the
most popular of the commercial versions.
If I ran an end fed half wave, I don't think there would be a
drastic difference between feeding from the end, or feeding
from the center with the coax sleeve version. Both have
their problems. If I run a dipole, I feed it normally from the
center, and the line runs away perpendicular to the wire.
IE: normal config.. The average 1/4 wave ground plane will
usually outdo a coax sleeve 1/2 wave, if the 1/2 has severe
common mode problems. This was the case on 2m for sure,
and it's most critical there. I never ended up using that coax
sleeve halfwave. My 1/4 GP smoked it on 2m.

I simply didn't want to deal with any 'VSWR' issues from a dipole configuration.
So, a simple end fed wire meets my needs.

Reading the schematics it is possible that the ANC-4 does not
fully cover the 360 degrees phase shift, just like the MFJ-1025.
But it is also possible that you experience more than one noise
source on 75 mtrs. A noise canceller (with two inputs/antennas)
can cancel only one noise source.

I have written about noise cancelling on my site, e.g.:
http://www.pa0sim.nl/Phaser%2080%20-%2010%20meters.htm
May be it can help.

8 turns loose wound in a 6.625" diameter bundle looks like an effective single band balun for 80m (approx 500 ohms). W6TC's voltage balun (Feb 1980 Ham Radio) uses 6 turns loose wound on ~5" diameter (8' total length) but adds a compensating winding in the opposite direction. It has nice characteristics for 40-160m but can only be used with balanced antennas (e.g. dipoles, inverted-Vs, etc). I've used a W6TC balun for many years on a trapped 80/160 inverte-V.

A ladder-line fed dipole might present an impedance of
8000 ohms to the choke. A 500 ohm choke would have
very little effect. However, a self-resonant choke
might have 40K ohms of choking impedance and it
would need to have a lot more turns than 8.

This would only be true for a resonant coax-fed 1/2WL
dipole. What about all the other possible configurations?

Try your local car stereo place. About the size of a tennis ball can.
Best Buy has some on their website. Search for capacitor.

John,

You describe a problem that could be caused / exacerbated by one or
both of:
- lack of electromagnetic compatibility (EMC) of your computer; and
- a hostile RF environment.

Before you lay blame at the computer, it is worth whether the RF field
strengths, and conducted and induced currents and voltages in your
shack are unnecessarily high.

You have give very little description of your antenna, feedline, and
station earth... too scant to analyse and offer much advice.

The hint is there that this problem is evident on 80m, while 40m seems
OK. Why is that?

Is the identified PC problem really a manifestation of a "hot" shack?
Have you conducted any experiments to identify excessive common mode
feedline currents in the shack (the same procedures you might follow
if you got an RF burn from something in the shack)?

Owen

Hi Jim,

1 FARAD (or bigger) capacitors have been around for YEARS. Go to any
Hi-Fi shop and spend as much as you want. Be warned that cost is
proportional to breakdown voltage rating.

Or try:

I did exactly this (20 years ago). I used a variable compression trimmer capacitor to check that I could actually get a low SWR, measured it, and fitted the nearest value disc ceramic (rated at 500VDC). I think it was 330pF. No problems with 40W.

Ian.

OK where can I buy a 330pf cap? Its only a 25 watt rig but I would like a bit of overkill.
Pisses me off that Radio Shack is a cell phone store now. I used to be able to walk into Radio Shack and the person there would understand what you needed. Now if it does not have to do with cell phones or car audio they just give you this dumb look..

Thanks
Joe

>
> tom
> K0TAR

gosh, i sure do appreciate everybody's help, sincerely, but alas, i
still have no concise way to calculate what size battery or cap i need

but i can add a few things, even thou it's sorta a different topic
many here seem concerned about the size of the canisters and refilling
them, this is not a concern as the unit will be feed directly off a
large Hydrogen tank, not the little canisters i do not need to
calculate how long the unit(jado) will run at load vs fuel supply this
is already a known constant and published thats the easy part

the unit does 12v unregulated at about 7amps if you hit 7amps for long
voltage goes down to 10v so i will add some regulator if needed

when i said my radio(2m mobile) will be ""putting out 5w on low pwr""
i ment 5w rf output not current draw sorry

so rich since your calculation was for ah what would it be for for the correct above spec's?? amps or 100w (no ah)?

i would have to have a battery big enough to be -drained little enough so that the jado would be able to recharge it during the rx time(least load) from what tx drained the battery obv if the battery is too big then the jado wouldn't be able to recharge it or float it

right now i have 2 G27(parallel) and i float them at less than 1amp

naturally when i say recharge i don't mean from anything other than a slight drain as in normal tx /rx

so the question become how do i calculate that? and would a ultra cap fit in ?

i thought it would be kinda simple, gut wise i can guess but what i was hoping for here was a more precise calculation of what would do the trick

again thanks all for taking the time to respond , i always learn something

ml

More likely a knee jerk reaction to the very few but very vocal ones who try to come in and act like they know all there is to know about radio when the "ink isn't even dry on their license". It's unfortunate that the experienced hams don't have the discipline to withstand this nonsense without such knee-jerk reactions.

When a new licensee (the level of license is irrelevant) tells me that you can't work DX without an amplifier, I just tell him about the countries I worked with my 100 watt radio and relatively low mount G5RV. But some hams turn bitter instead when a newbie insists that he is right and they are wrong.

I thought my statement was clear, but I will repeat it -

"So you would probably be well served by one of the 7AH UPS batteries
from a place such as Batteries Plus. They cost about $25 and are about
7"Lx2"Wx4"H." Float that across your fuel cell and you will be fine.

Of course, if the fuel cell doesn't put out at least 13.5 vclts with
your rig on receive, a "12 volt" float battery won't have enough charge
in it to speak of. Then it would be back to capacitors and the
interesting problem that they would bring along. Such as a 0 volt
charge current that could possibly be damaging to your fuel cell.

This whole thing seems a very expensive way to have not very good
portable power. You have never stated why you must have a fuel cell.
Would you care to enlighten us?

And if the 5W output rig draws an amp on transmit, that 50F cap will
run it for 50 seconds with a one-volt drop. Compare that with an
inexpensive little 7Ah 12V gel-cell battery that will run it for
probably five hours. Caps may make sense to smooth over short pulses
of current, but seem like a poor solution for storing long-term energy.

The OP's question is so basic that I wonder if he's pulling our
collective legs.
--How many amps does the rig draw in transmit? In receive?
--How long do you want the aux power source to run it?
----how many hours of transmit; how many hours of receive?
--That tells you the minimum Ah rating for the aux battery.
--Use I = C * dV/dt and how much voltage drop you can stand
to figure the size capacitor you'd need to do the same thing
for an aux capacitor (and then discard the idea in favor of a
much cheaper battery).

Cheers,
Tom

That is correct. That is because you are a tech and cannot work HF at all!

Like Dee, I've worked stations worldwide with "just" 100 watts and a G5RV
and you could too, if you'd but learn a paltry 5wpm code speed.

>
OK, that was clear, i sorta thought it seemed a bit small, and figured
you calculated at 100ah nnot 100w my bad

> This whole thing seems a very expensive way to have not very good
> portable power. You have never stated why you must have a fuel cell.
> Would you care to enlighten us?
>
> tom
> K0TAR

well if one had to buy the jado it might be expensive, i can get one
much cheeper than list and somone here posted an incorrect list price
anyways , - then again if you add up the total cost of the
competition you'd at worst case be in the ball park

the goal was at first to power a hf/rig 100w tx for a few days on a
backup power source looking at batteries/fuelcells i realized this is to
much load so i figured my 2m righ on low pwr is a compramise @1week

at 100w tx, i started to put together on paper what i need, a pretty
big charger lots of very big heavy batteries , and they are VERY
expensive, if the batteries went 'low' and the power wasn't restored
say an extended blackout then the battery life goes down the tubes

now i live in an apt, so too many batteries even if free arent practical

code prevents me from using a generator in the building, so would the
coop board, and the noise, smell vibration and mostly a generator
running would attract 'undesiables' it would be kinda cheep and
storing say desil wouldn't be a big deal if say i had a pvt house
again thou getting extra fuel in a extended blackout would be an issue

i had a demo of this fuel cell i was really impressed, is the cost and power output totally there no i guess not a few years from now prob but the cost of the fuel cell unit alone is comparable to the battery cost and i don't have to worry about the space, and other issues associated w/batteries

i can get a small tank of hydrogen that would power the unit for longer than i was planning for it's cheep and i can get it very easy even if theyre was an extended blackout (details omitted) it's quite meets code, very small, very light dosn't pollute or stink

seemed rather sexy the jado can also be powered from small cartridges making the unit selfcontained and very portable, however this isn't a requirement of mine but cool benni

the only con for me, seems to be a)not totally going to give me 100w at full load b) i wish the unit was more than a puny 100w the larger units i would have to pay full list for and are therefore outta reach

so solar /wind again might be nice in a pvt home but nothing i'd rely on

it usually starts simple, i wanted somthing better than battery power

much appreciation
and mostly also because i like to tinker and learn seems like somthing cool to play with and experiment

Ok, I have applied a simple power budget to what you stated your original desire was, as opposed to your cut down 2m 5W system.

Using a rig I own, an FT-897, on HF.

Assume 90% receive at 1 amp.
Assume 10% transmit at 15 amps with 100 watts output, (measured as opposed to the 22 amps claimed in the docs)

This gives 2.4 amps average consumption. (Check my math, the doctor did a lot during my pre-op today)

1 week is 168 hours which gives us 403 ampere hours.

100AH deep cycle batteries are around 100 each (or less), So that's about $400 for all the batteries you need for a week without sleep.

A modern top of the line charger, such as produced by Schumacher, is less than $100, does automatic desulfation, will charge at 50 amps or greater, and weighs about 6 pounds.

So now we are at under 500 dollars for an emergency power for any ham that needs to run an HF rig for a whole week.

I just don't see why you want to use the fuel cell, it makes no sense.

> . . .

which at 13.6 volts is about 5480 watt-hours. This is the energy storage requirement.

The OP asked about using a capacitor. The energy stored in a capacitor is C * V^2 / 2. For capacitance in farads and voltage in volts, the result is joules, or watt-seconds -- you need 5480 * 3600 ~ 20,000,000 joules in round numbers. So suppose you wanted to store this same amount of energy in a capacitor, and you had a switching regulator which would handle 50 volts maximum input voltage. Solving for C, assuming it's charged to 50 volts,

C = 20,000,000 * 2 / (50^2) = 16,000 farads.

This assumes you can get all the energy out of the capacitor, which requires your regulator to work down to zero volts. But you'll get 3/4 of the energy out of it if your regulator cuts off at 25 volts, 7/8 if it cuts off at 12.5 volts, etc.

How does that sound?

"Now if it does not have to do with cell phones or car audio they
just give you this dumb look.. "

Heh.. went into my local Radio Shack and asked if they had any antenna
masts in stock. Guy goes and looks on the shelves. I say "I'd like a
TV mast, it's in the back if you have it, it's ten feet long" Guy
looks on the shelves some more, points to the mast brackets.

I'm like, "It's a ten feet long piece of steel pipe it wouldn't be out
here, it isn't out here, it wouldn't fit out here, it's in the BACK."
I look it up on the internet on the computer in the store and show them
that yes, they do have them in stock.

Of course, he doesn't think they've got any. Twenty minutes after I
walk in, I'm finally leaving with a five foot and a ten foot mast
section which they, of course, had. Guy is just incredulous that I'm
going to walk out of the store with a ten foot piece of pipe. They
then ask me if I need a cell phone ;-)

1533. Large Wire Antenna for 17m

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-27 05:23:15 UTC
From: Alan Taylor <adt1944@hotmail.com>
Message-ID: <454197c4$1_1@news.iprimus.com.au>
Source record: 50407

I have some space and some high trees. I already use a 400ft doublet with atu for several bands and a 30m half square and get good results. I want to improve my performance on 17m. I am now thinking about a wire antenna with reasonable performance for 17m only. I have thought about a full wave loop, even a bobtail. A broadside array would be great but I am not keen on antennas with reflectors or directors because of the complexity of support ropes. So, really some kind of antenna supported by ropes from two trees would be ideal. Any ideas please?

Nice website, have you considered modifying the existing units (MFJ & ANC)
to do what you have shown? Your idea would make either of these 2 units much
better.

By the way, I took the sense antenna which is a short dipole and I made one
leg vertical and the other horizontal. Now I have almost no noise on 75
meters. I haqve been playing around with this for awhile and it was either
all vertical or all horizontal. Now with this configuration the weak
signals can be heard.

the way I understand it, the sense antenna is supposed to pick up the noise
better than the signal you wish to receive. So VSWR most likely would'nt
matter.

The problem you'll run smack into with any fixed antenna is that to get gain in one direction you've got to take away gain in others. So the first thing you have to decide is which directions do you want to improve your signal in, and which are you willing to sacrifice. Then consider where your trees are. Only then can you begin to consider what kind of antenna might deliver what you want.

Thanks Roy,

I should have mentioned the trees are in position for a broadside array to fire in the (two) directions I need.

I would use the trees that currently support the 30m half square firing NE/SW.

Hi Stan,
I have considered it, but sometimes it is easier and better to start fresh.
First question is always: what phaser/noise canceller do you really want?
What do you expect from it?
Looking at the design of the MFJ-1025, it would take to much mods to
realize my needs.

When one of the antennas doesn't hear the noise source, you don't need
a phaser. But of course that antenna still has to hear your wanted signals.
Using a small loop antenna it is sometimes possible to null the noise

source.
I think playing with a short dipole, as you did, is the same as nulling with small loops.

Roy, ruling out quad loops and multi element antennas what do we have available? I like the idea of working both LP and SP to the US but if you have an idea for a wire antenna supported by only two ropes I would consider that. What would the pattern be like for a bobtail with extra vertical elements spaced the usual half wave? With the trees I have in mind I could possibly fit in six vertical elements.

Thanks es 73 Alan

well i guess it sounds like i wont have any 16,000 farad cap's stacked
up in my myplace anytime soon, but i understand the math behind it
now thanks

perhaps i'll just get a small cap to handle a brief second keydown dip
smooth things out a bit

thanks

> tom
> K0TAR
tom, am i to understand you had some surgery today? if so, i hope all is well with you and taking the time to write is appreciated

i am guessing roy's calculation of the total ampre hrs needed is closer to being correct, but it's 5am and i kinda don't know how to calculate that so i dunno as stated in my earlier post i don't have the formulas so i can't act to confirm but i nod my head and presume it's all correct based on roys math

you are correct about what the rig is doing mine is exactly simular i would calculate based on 20amps

re your last comments on why i would want a fuel cell, it should be very clear in all my many posts

5480 watt-hours of battery is more $$ and large than i have practical room for

i can get the fuel cell for practically nothing and i just thought it might be able to offer some useful power to top off a battery to provide some b/u power why not? and also be a fun experiment it runs quiet , clean and i can get all the fuel i want free always, i would never be able to get fossel fuels in a blackout or other emerg

so now i inch a drop closer knowing how many what hours my original abandoned goal would draw , however my current stated goal is to just power my 5w tx output(draws4amps) 2m mobile rig

and try to calculate how much the battery would be drained in a 1min tx and then see if the 12v 7amps comming out of the jado would recharge it fast enough i believe that is what must be calculated for just not sure how do it, unless you still say a 7amp battery is still 'ok'

my goal was to be able to calculate

so a 7amp battery(or what ever is needed optically this seems like a too low a #)) w/a 1min 4amp load would be ??%drained
then based on manuf spec's for the battery we could calculate how much power &time would be needed to top it back off

then it would be simple enough to see if the output of the jado is sufficient i think thats all thats needed i think that's simple
but i dunno how to calculate it
thanks all i really wanted to do

Since you are supporting a 30 meter vertical, I suspect that you can
support a 17 meter half wave vertical.. A halfwave, bottom fed,
monopole, worked against an elevated counterpoise... Said elevated
counterpoise to be a half wave in length, and tapped at it's
centerpoint... Two or three feet off the ground will work, while head
high would be nice...
A single antenna will give 360 coverage... Two, three, or four of these
with switching to rotate the pattern will give you gain in given
directions, while still allowing 360 coverage...

i bet you also find that storing explosive gasses in an apartment are also against code. and laywers would probably consider a fuel cell a generator also.

your best bet is to just keep a few gell cells around to run your vhf on low power, you can get many hours on a charge... when one dies, swap for another one, take it out to your car, charge it from there, and bring it back in.

remember, in an emergency you most likely won't be making long transmissions anyway, first because there won't be that many locals to talk to because most of them won't have power... repeaters will be tied up with emergency traffic, and unless you are a net control you should mostly be listening.

There's a disconnect between these two statements: they make very different assumptions about the level of performance that is needed.

A couple of days ago, Bill re-quoted the WA2SRQ measurements, which are the same ones we've been discussing for the past week (seems like more :-)
http://www.bcdxc.org/balun_information.htm#Ed,%20WA2SRQ

However, it's very interesting to read the whole of that web page, which is a much longer discussion involving several other designers and users of feedline chokes (aka choke baluns). In that discussion, there was a largely unspoken agreement that, to merit being called "effective", a choke should have an impedance of at least 10 times the cable Zo, ie at least 500 ohms.

If 500 ohms is all you need, a coiled-cable choke of either the "bunched" or the "solenoid" type certainly can cover at least two amateur bands an octave apart in frequency... but a wide range of ferrite chokes can do the same, and these have the advantage of being much more broadband so they need no tuning.

In contrast, Cecil is asking for a much higher impedance. If that's what you really need, then nothing can beat a resonant coiled-cable choke, which can give a resonant impedance well above 10kohms and possibly as high as 40kohms [1]. Even the very best ferrite choke can't come anywhere near that... but the resonant choke will always be a single-band device and will always have to be adjusted carefully.

[1] Measurements on various kinds of chokes, at:
http://w8ji.com/Baluns/balun_test.htm (table about half-way down the page).

The performance of a common-mode choke is always going to depend on the exact situation in which it is used, so the measured impedance can never be more than an indication of its *potential* performance. For example,

a 500-ohm choke may completely kill the common-mode problems at one station (or on one band) and have almost no effect in a different situation.

On balance, it might be better to say that 500 ohms should be considered the *minimum* value of impedance that can offer some promise of being useful in a wide variety of different situations.

But maybe Cecil is setting the bar too high by imagining the worst possible case. If an antenna/feedline system has a common-mode problem that needs an almost impossibly high value of choking impedance, then (as I said earlier) the choke isn't really the thing we should be looking at. It's the root cause of that problem - the antenna and/or feedline itself - that needs attention.

A horizontal 66 ft. dipole fed with ladder-line would
work for 40m-10m and give you some gain over a 1/2WL
dipole on 17m where it would be an Extended Double
Zepp. EZNEC says feeding it with 9 feet of 450 ohm
ladder-line and then coax the rest of the way gives
a pretty good single-band match on 17m.

Ian White GM3SEK wrote:
> But maybe Cecil is setting the bar too high by imagining the worst
> possible case.

I immediately followed that posting up with another in
which I said 500 ohms of choking impedance is sufficient
for a resonant 1/2WL coax-fed dipole. But assuming the
1/2WL dipole is resonant on 3.75 MHz, 500 ohms of choking
impedance is really not enough at the band edges.

There's another consideration. The location of the common-
mode nodes and antinodes are not necessarily related to the
differential signals because the velocity factor is different
for common-mode signals Vs differential-mode signals. One
could encounter the "worst possible case" and not even be
aware of it.

The moral is: Follow Ian's advice and actually make common-mode
current measurements before and after installing the choke.
I have seen the installation of a choke actually increase the
common-mode current at a point 1/4WL away from the choke.

As others have said, you need to decide where you want to point it first,
because something with significant gain is going to be directional.
For 17m you probably want to go horizontally polarized if you have high
trees.

You might consider a horizontal vee beam, the lengths and enclosed angled
are relatively non-critical. It would also work well on 20 and 15m. I have
also constructed tree-supported yagis (wire) and quads, but you do need to
tune the parasitic elements carefully to get good performance.

Two triangular quad elements (flat side up, fed at bottom point)
separated by three PVC pipe spacers makes a nice quad that will hang
between only two supports. I used to have a couple of those up for 20m and 15m.

If you can get it high enough, and I assume you can, why not a Delta loop with the apex at the bottom? I have tried several different 17 meter antennas, but the Delta loop is the best I found. True, it is only bi-directional, but mine is NE/SW and works pretty well in those directions. I use a Sigma 5 vertical dipole for everything else, but the loop is better that the vertical in it's favored directions by a lot.
I also used a half square on 30 meters, but have since removed it in favor of a simple inverted vee. I found the half square, while very effective on transmitting, was noisy on receive. The vee 'heard' things better and seems just as effective on transmitting. Fortunately, I was able to get the vee's apex up to 45 feet. Anything lower than that favors the half square on 30. I mention this because I also tried a half square on 17, but the loop was MUCH better.

The following two steps seem to have solved the problem I had on 75 meters, at least when running the Orion transceiver barefoot.

1) Ran #12 wire through the 2nd-story window sill and down to a 10 feet long copper clad ground rod. The length of the wire run is about 15 feet. While this may seem to be an obvious step, at my previous QTH the use of an earth ground made RF feedback problems worse on some bands.

2) Installed an Amidon FT-240-77 ferrite toroid as a common-mode choke (11 turns) in the Orion's DC power supply cable and located about 18" from the Orion. I am using an Astron RS-35A linear power supply (the fan on the Ten-Tec switching PS was too noisy). The cable run between the power supply and the Orion is somewhat lengthy because the Orion is connected to an MFJ-1129 multi-outlet strip.

Step 2 above seems to have also corrected an occasional "flakiness" in the operation of some of the front panel controls, which I had blamed on progressive failure of the RIT/XIT encoder. Furthermore, for some inexplicable reason, the computer problem I had with the USB connected keyboard has disappeared with the installation of the Orion's power supply cord toriodal filter!

Just one other thing to be aware of, with the dipole being nearby. Things
other than the computer can be affected. I had an dipole that coupled into
the central air/heat control box, because the control wires ran in the attic
parallel to, and about 15 feet from the dipole. With 100 watts, I managed
to burn out the control box solid state stuff. I didn't look to see what
the control wire resonance might be, but a snap on toroid was used to solve
the problem with the new control box.

As I continue my slow study of vertical antennas I am nearing the point where I need to plan a radial system. It is no big surprise that Everything I am doing has been done before but this is intended to be a learning experience.

The red North Carolina clay varies widely with the seasons, I hope to be ready when the ground softens up to where I can bury the radials. The current plan is to build a mechanism that will allow me to do the job from the seat of my tractor. I would prefer to not use fence staples because I expect they would forever plague me in my tractor tires.

The question:
I seem to be the only one inclined to use electric fence wire for radials. I know from experience that the galvanized steel 17 ga will last in excess of 10 years. I have found the Aluminum to be lacking in strength when I use it for antenna experiments. Both are available for less than $45 per mile.

My notes on the project are at
http://dixienc.us/28FtVert/28FtVertical.htm

The second page is recent.
Not much "meat" for the guru's, but may be interesting reading or reference links for the curious.

Hi, John.
You seem to be confusing radial wires with ground screen wires. Radial wires must be insulated from the ground because they need to be specific lengths for the frequency they are cut for. The ground screen is made of non-inslated wires on the ground surface, or buried slightly under it.

I think the "staples" you are refering to are just wire "hair pins" to hold the wire in contact with the soil. Where you live, grass, etc. should grow over the wire in no time! Here in the desert, rocks are used to hold the wire down.

There was a commercial AM radio transmitter/tower behind my place. I salvaged many hundreds of feet of #16 bare copper wire from their ground screen. It was just under the surface and held in place with lava rocks. The tower base was concrete with 8" wide copper flashing between the base and the tower. It was soldered to a copper mesh around the concrete base. The ground screen wires were just twisted into the copper mesh.

Our neighbor said the whole thing was a wonderful lightening rod!!!

I've never had a problem with the large garden staples getting into tractor tires. If you are really concerned, you could probably get away with one staple at the very end of each radial and then remove it after the thatch grows over the radial. I would never go to the trouble of buring radials myself. I now have about 130 ranging in length from 70' to 150' under my 180' tower for my 160 system. If you still want to bury your radials here's a neat idea by SM2CEW:

I put down about 10 rolls of welded galvanized mesh fencing (3-4' width by about 50-100') under my tower in 1997. Those rolls completely rusted several years ago and I disconnected them recently. My soil is mostly red clay (QTH is NC also) with some sandy loam areas. In my case the mesh was probably overkill anyway since my radial field alone is sufficient close to the tower. I have used galvanized wire for Beverages and it lasts forever when suspended in air...but that was not my experience with it on the ground. Aluminum is also not a good choice because of interaction with acid in the soil. Copper is best but the prices have now skyrocketed so much I can understand why you are looking for other alternatives.

Good luck with your project!

The ground detunes the wires so it doesn't make a
lot of difference if they are insulated or not. For
the same reason, the lengths are not very critical.

I am looking for the easiest way out for me! I mow the three acres of grass with a small Ford Farm tractor and a belly mower. It is seldom cut really short but I still fear picking up the wire in the mower. I have used home brew wire staples when I lived in Ohio but this soil is pretty tough for that. The SM2CEW Plow is what inspired me to consider burying the wire to begin with.

I think it likely that I am considering more radials than are practical anyway. 500 feet of #14 insulated wire was less than $25 the last time I bought it.

Mow it as low as possible when the grass is dormant, put down the radials, staple them and then let the grass grow as high as possible before mowing at a medium height. If you put the radials down now, I suspect they will mostly pack down before the grass starts growing again in the spring, especially if we get a couple of snow or ice storms.

> I think it likely that I am considering more radials than are

Here's a simple formula to save you money since I've heard that same roll of wire is now around $45! No matter how long your radials are, put the ends down such that they are ~0.025 wavelengths apart on the highest frequency band you plan to use. On 160 this is ~13', on 80 6.5' and on 40 3.25'. This works out to about 63 radials total if they are all 1/4 wavelengths long in a circular configuration, but the formula also works for random lengths in non-circular configurations. The idea is to have the end points no more than ~0.025 wavelengths apart. While ON4UN's book suggests 0.015 wavelengths apart, some recent measurements by N6LF seem to indicate that may be overkill (i.e. 60 radials are within a few tenths of a dB of 120 radials).

Hi Ian,

I haven't read to the depth you have, but if your synopsis is
accurate, they are wrong. The generality should be 10 times the
source Z.

>If 500 ohms is all you need, a coiled-cable choke of either the
>"bunched" or the "solenoid" type certainly can cover at least two
>amateur bands an octave apart in frequency... but a wide range of
>ferrite chokes can do the same, and these have the advantage of being
>much more broadband so they need no tuning.

And if the antennas exhibit a near-match, 500 Ohms is sufficient as
those antennas will be presenting a low (~50 Ohm) source Z.

>a 500-ohm choke may completely kill the common-mode problems at one
>station (or on one band) and have almost no effect in a different
>situation.

This would the consequence of a very high source Z, such as a half
wave end fed design.

>On balance, it might be better to say that 500 ohms should be considered
>the *minimum* value of impedance that can offer some promise of being
>useful in a wide variety of different situations.

Minimum, optimal, best, standard.... All such terms demand a criteria
that is trying to be met. No choke is 100% effective. The two most
compelling of those criteria are
1. RF shock hazard;
2. Antenna null filling.

The shock hazard is often ignored if it is not perceived (can't feel
it, and yet instrumentation might be pegged).

Null filling, or poorer F/B, or F/S performance may only become a
nuisance or a real concern depending upon the individual.

My own standard is 5 times the source Z, or at least 3 times the
source Z. 5 times is suitable for reasonable measurement accuracy,

but filling some other criteria throws us back into the subjective quagmire.

Hi Myles,

You are suffering from easy access to an answer to the wrong question.

First, investigate/research DC-DC converters. We've been through this once before, haven't we?

The various storage methods you've been cycling through Cell/Battery/Cap all have different voltage parameters compared to the eventual load. True, the battery naturally fits that 13.6V requirement, but it eventually fades.

With the right DC-DC converter, you can accommodate almost any scenario you've described and efficiently transform to a steady reliable voltage source capable of meeting the current load.

With the right DC-DC converter, you can also meet the requirements for recharging a cap or a battery from any other source (Cell/Battery/Cap). Flexibility allows you to move from any power source to another and still supply your load reliably.

In the spirit of trying to get something going on the subject of antennas, and away from all the off topic posts......

Are you doing anything interesting with antennas? Putting anything up new for the contest season? Learn something new that the rest of us might benefit from hearing about, even if it isn't patentable?

For me, I have become interested in rhombics and am currently building one. It was based on the one featured in the ARRL Antenna Book, which is 377 feet long (right down the middle) and 210 feet on each side. 210 feet is 3 wavelengths on 20 meters. So far I have learned a little about the rhombic. It can be built as a terminated rhombic or a "resonant" rhombic. In the case of a terminated rhombic, you install a 600 ohm resistor at the far end, and that absorbs the power that would otherwise be radiated off the back, making the antenna uni-directional. Another advantage is, the feedpoint Z is approximately flat and equal to 600 ohms across a huge frequency range. So the antenna has gain and lots of it, at least over the range of 20-10 meters and everything in between! If you don't terminate it, it works the same way in the forward direction but has no front to back. And the impedance varies all over the place. But does anyone have a 600 ohm resistor they could supply me with? 300 watts or so? Noninductive.

So getting down to practical details, here's some of my experiences so far. Copper wire has gotten very expensive. #14 stranded down at the local Depot store is now 8 cents a foot, #12 is 14 cents. That adds up fast when you need 840 feet of the stuff. So I managed to find a roll at 900 ft on eBay for about 60% of that and got it. Now the problem with #14 is it sags. Well maybe not, maybe it is the rope holding the end up, it is very hard to pull up 200 feet of wire and get it to where it doesn't look like the suspension cables on the Verrazano bridge.

Ok so now how to get the rope up high enough in the oak to make it useful? Bought a slingshot. For-get-it. I tried bolts, nuts, fishing weights, etc, can't get the damn thing with fishing line to get over 16 feet and most of the time it tangled the line and sometimes actually ended up behind me. Crosman Slignshot for sale, $25 shipped to your door. Here's what works for 25 feet.... get xyl to climb a ladder in the back of the pickup parked beside the tree. She takes a tennis ball with light dacron rope taped to it and throws over the branch while I shout encouragement from below. It works. (oh, by the way, xyl is KC2PRW). That's the good news, the bad news is 25 feet ain't high enough, with the sag problem mentioned above.

Next, get bow and arrow from neighbor, yeahhhhh !! that works. Now got line over 35 feet, that's decent. Same success on 2nd tree. Now got the feedpoint tree and one of the corner trees with nice lines up 35 feet. Now pull up the wire and notice that the smallest little friggin branch in the oak trees will snag the #14, so get the ladder and trim off dozens of those little suckers. So that's where we are at the moment. I figure about 50% done. Now the question is, will it work?

I found (google can find anything) a great circle bearing program that told me to point it 47 degrees which, from New Jersey puts me right over London and down into central Germany. Look out DLs. According to my antenna modeling program it will have 14 dbi gain and a 3 db beamwidth of 20 degrees. Man that is sharp, much sharper than any 3 element beam. What's with these dbi's ? For comparison, a 3 ele beam at 70 ft will have 12 dbi gain. The rhombic at 30 ft has its main beam at about 22-25 degrees elevation. I sure wish I could get it up to 70 ft, but there's no chance.

So now I have to get two more trees rigged with ropes and then get down to the business of feeding the monster. I will be using balanced ladder line to a homebrew tuner which I haven't built yet.

If I get any positive feedback on this post I will continue with my progress and maybe even provide some on-air results in a week or so.

So that's my story. What are you working on?

Rick K2XT

If your rig draws 4 amps (I assume that's on transmit; it would be an
awful lot of power for a modern receiver), and the fuel cell can put

out 7 amps continuously albeit at slightly reduced voltage, and I assume it can put out 4 amps at less of a reduction, why are you worried about it? Unless you are VERY long-winded with your transmissions, a small 7amp-hour sealed lead acid battery would give you a couple hours operating time even if it wasn't being continuously recharged. I'd actually opt instead for some voltage stabilization at the fuel cell output: a buck-boost regulator would do it. If you trust the fuel cell to do its job, then trust it. If you don't, then provide a backup. So what I read between the lines you've written is that you're going to get this fuel cell, but you don't really trust it. You don't even trust it to come close to what are apparently its published ratings.

Pretty much all the formulas you need to figure all this stuff out:
power = voltage times current (watts = volts * amps)
energy = power times time (joules = watts * seconds)
--> total energy needed = sum of (each current times the length of time that current is drawn)
amp-hours = amps * hours = amps * seconds / 3600sec/hr
battery energy storage in watt-hours = amp-hour rating * volts (assuming full charge)
battery energy storage in joules = amp-hour rating * volts * 3600 sec/hour
capacitor energy storage = (initial charge voltage)^2 * capacitance / 2
joules = watt-seconds = volts^2 * farads / 2
watt-hours = joules/3600 = volts^2 * farads / 7200

Where is it that you can get a license without knowing at least this much? Why so much trouble with the concepts of power and energy calculated from current, voltage and time? (Why is this posted to an antennas newsgroup?)

Cheers,
Tom

At $45/500 feet it is still a long way from Cost prohibitive.

Do I misunderstand? My intuition is to place the radials I use over as
much area as I can. The way I read your note is that they should be
installed in a small sector... I think I am misunderstanding that
point.

Also, on the distant planning horizon I will likely use the Radial
field for a permanent Multi band Vertical. The current 28 foot
radiator is simply a convenient place to gain experience.

I am inclined to pursue the advice presented in the article
http://www.ncjweb.com/k3lcmaxgainradials.pdf

Ian,

I agree that this criteria is oft cited, but it bears examination.

It seems to derive from a bench test of a balun, where the balun shunts the balanced load (on one or both legs) by some impedance, often assumed to be purely inductive reactance (though that is not true from some baluns, eg the common W2DU style), and that if that impedance is 10 or more times the balanced load impedance, then the impact of the shunt reactance is negligible, and the common mode current caused by a single leg shunt is negligible.

This might be a reasonable criteria for a balun in a bench situation or equipment room situation (eg between instruments or boxes with a mix of balanced and unbalanced interfaces), it should lead to low insertion VSWR which might be important if one was VSWR focused or obsessed.

I suggest that such a criteria is not complete enough in itself to predict the impact of the balun on common mode current or balun loss in an antenna + feedline + transmitter + ground scenario.

NEC modelling of some scenarios suggests to me that effect of common mode chokes at different frequencies depends not only on their impedance, but also on their location, and that sometimes more than one choke may be more effective than a single larger choke.

Those models also reveal the standing wave nature of the common mode feedline current, and the futility of taking a current probe measurement at a single location to infer any more than the current at that specific location (if that was important).

You can build a load out of 2 watt resistors if you are careful with
your design. Design the load as a string of attenuators with each
section dissipating about 50 watts or so. I ve done this with 50 ohm
unbalanced design but never with a balanced line. Also consider making
a lossy transmission line, perhaps using some nichrome wire.

Hi All,

I've found one excellent source for high resistance wire can be found
at the thrift store: 5$ Toasters. Each element is curiously close to
50 Ohms.

That was very much what I said, farther down the message from which you quote.

Impedance isn't everything, but it does show the important difference between "good" chokes that are capable of making a large change, and "poor" chokes that will always have a much smaller effect.

The next thing is a different point, which can limit the effectiveness of even the best of chokes.

>NEC modelling of some scenarios suggests to me that effect of common
>mode chokes at different frequencies depends not only on their
>impedance, but also on their location, and that sometimes more than
>one choke may be more effective than a single larger choke.
>

>feedline current, and the futility of taking a current probe
>measurement at a single location to infer any more than the current at
>that specific location (if that was important).

Common-mode current is well known to be "standing wave" in nature, in the sense that it has maxima and minima alternating along the line, separated by an electrical quarter-wavelength.

If you disrupt this pattern by inserting a common-mode choke at a current maximum, you're going to force a current minimum at that point. (That can only happen if the choke has a sufficiently high impedance, but let's assume it has.) RF currents on the entire antenna-feedline system will then rearrange themselves to take this new factor into account.

But something must have caused this tendency to have significant common-mode currents in the first place - most commonly an asymmetrical layout of the antenna and/or the feedline, eg when the feedline to a dipole runs parallel to the antenna underneath one side. A common-mode choke can treat the symptom (the common-mode current) but it cannot remove the root cause (the layout). In such cases, inserting a choke will cause a new common-mode current maximum to pop up, a quarter-wavelength away.

Now if you insert another choke at this new current maximum, you have made it extremely difficult for the line to support any common-mode current between those two chokes - but yet another new current maximum will pop up, a further quarter-wave away. So on you go, rather like trying to squeeze down a long balloon...

However, you are actually making progress. Every correctly placed choke makes it more difficult for common-mode current to exist on the line, and takes you farther away from the local field of the antenna.

The name of the game is to reduce the common-mode current along the whole of the feedline, as much as you can, but above all to reduce the current at the location of the equipment that is being affected (eg the transceiver). Therefore it's always important to monitor the current at the victim equipment, and be aware that it can sometimes increase.

In practical terms, the two most important places to try a common-mode choke are:

* At the end of the coax, where it breaks out to feed the antenna, or into parallel line, because this is where common-mode current can be launched onto the outside of the coax by a direct hard-wired connection.

* At the victim equipment in the shack, or at some "gateway" point like the ATU.

Because of the "pop-up" nature of the current maxima, there are always exceptions for certain layouts and feeder lengths, but these are two good practical places to start.

It can be difficult, and an RF current probe will be your best friend and faithful tracker... but it's never futile.

At the former AT&T High Seas site at Ocean Gate NJ that I am
associated with they terminated rhombics with some kind of wire (looks
like shiny aluminum wire) in the form of an open wire transmission
line. It comes down the pole and then runs back toward the feed point
near the ground, then turns and comes back the whole length of the
rhombic, and does this 2 or three times - a lossy transmission line I
guess.

I have good performance out of a sleeve antenna on vhf where the sleeve was quite a bit larger tahn the coax running up the middle. RG 58 inside 1-1/4 inch sleeve. This was on a vertical antenna. Ferrite beads aided in decoupling the coax, small bits of styrofoam were used to keep the coax centered in the sleeve. Antenna was supporte by placing it in a fiberglass tube. I could see how this could be a real PITA to do horizontally.

I have the ANC-4 which works well. This new sense antenna is really good, as I can hear signals down to S-2 on 75 meters. I guess if I had to do it I would prefer to modify the ANC-4 as its a quality unit, not perfect but it is built well.

If you would have any ideas as to modifying the ANC-4 I would'nt mind working with you on this project. But I will leave that one up to you.

Hopefully I will be able to hear you in the contest this weekend on 75 meters!

Good Luck in the contest my friend!

Hi Cecil

I dont propose that there is any practical reason to build a horizontal coaxial-sleeve horizontal 1/2 wave dipole for HF. But your post suggests to me an interesting way to build a fullwave "dipole". Two coaxial-sleeve 1/2 waves, end to end, might provide a method of low impedance feeding a fullwave long horizontal "dipole". I might even try it at VHF.

Jerry

In fact, the common-mode currents on the feedline
turn the feedline into a standing-wave antenna.
I suspect that's how an Isotron antenna works.

Jerry Martes wrote:
> I dont propose that there is any practical reason to build a horizontal
> coaxial-sleeve horizontal 1/2 wave dipole for HF.

The practical reason is when it is not practical to
center-feed a dipole. If one is forced to run the
coax feedline very close and parallel to one of the
dipole elements, might as well make the element hollow
and run the coax feedline inside it.

I wonder if that would work for a half-square? Make
one of the vertical sections hollow and run the coax
up the center of that section.

> But your post suggests
> to me an interesting way to build a fullwave "dipole". Two coaxial-sleeve
> 1/2 waves, end to end, might provide a method of low impedance feeding a
> fullwave long horizontal "dipole". I might even try it at VHF.

There are two types of antennas called "sleeve" antennas.
One has the braid connected to the sleeve where the
1/4WL single center conductor emerges. The other has
the braid connected to the sleeve 1/4WL back down the
feedline from that point to achieve a shorted 1/4WL
stub sleeve.

> under it.
> . . .

In 30 years or so of reading and studying professional and amateur texts, I've never encountered this distinction. "Radial" refers to the fact that the wires radiate radially outward from the antenna base, and they're properly called "radials" whether buried or elevated. Common usage is to refer to buried radial wires as "buried radials" and elevated ones as "elevated radials". Either buried or elevated radials can be insulated or bare. Wires right on the surface of the ground sometimes behave like elevated radials (that is, show resonance effects) unless they're held down to make intimate contact with the ground.

When you see the term "ground screen" in the literature, it usually refers to something like buried chicken wire or other screen-like material.

I have a 20 turn choke wound on a 5.35" diameter
Quaker Oatmeal box at four turns per inch. I used
my Grid Dip Oscillator to determine the open-circuit
(parallel) self-resonance at 11 MHz. The short-circuit
(series) self-resonance is at 23 MHz.

This is a Knight Kit G-30 GDO with the original
6C4 still working. I built it from a kit in 1959.

Yeah, probably something like that. ;-) Actually, what I meant to
write was more like:
--> total energy needed = voltage * sum of (each current times the
length
of time that current is drawn.

Lesseee...unit analysis...volts * amps * time. OK, that looks better.

Thanks, Jim.

You want to cover the maximum area...but using the minimum amount of wire to do so effectively...which is what 0.025 wavelengths spacing between the endpoints yields.

> I am inclined to pursue the advice presented in the article
> http://www.ncjweb.com/k3lcmaxgainradials.pdf

The problem with all of K3LC's articles is that he only uses NEC-4 modeling with no empirical measurement data. N6LF's article below compares his measurements to the same NEC-4 model (see Figure 5 and last paragraph on page 5). Modeling programs are notorious for poorly handling radials on ground. Although NEC-4 is supposedly the best for this, the results N6LF reported (i.e. NEC-4 saying no improvement for more than 16 radials) are inconsistent with all measurement data going back to the 30's (including that used by the FCC for broadcast station commissioning).

http://www.antennasbyn6lf.com/files/160_m_vertical_measurements.pdf

You will find that from a legal perspective that natural gas piped in is not at all the same as storing a tank of hydrogen. Natural gas and propane are very highly regulated as to installation, equipment attached, etc. Very different than your tank of H2 will be.

They are good antennas if decoupled. Many have been used for
commercial/public service systems. A company called "Dodge" ??
used to sell a lot of them. Real heavy duty construction.. Their
version used two stacked sleeves. You could also use stacked
radial sets.

The EDZ is the easiest I suppose. About 5.1 dbi/3dbd if I remember
right.
You could run two half wave dipoles, spaced a half wave apart
with rope. Feed in phase. Also good for about 3dbd. The lazy H
antennas could be run between two trees. Too bad you can't run a
yagi. That what you really need.. Or at least the most bang for it's
size,
and it can be steered. Also, I guess you could run a larger franklin
type
array. IE: 3 or more 1/2 wave elements. BTW, you also can use
"extended"
lazy H type arrays where the elements are EDZ length. Gives more gain
than the usual 1/2 wave lengths.

> possibly fit in six vertical elements.

Of course, what I'd recommend is that you model some of these antennas with a program like EZNEC. The free demo program is adequate for some of the antennas you're interested in. The demo program is able to model some more complex arrays with quite an accurate pattern -- what suffers is the accuracy of the reported feedpoint impedance.

One antenna you might consider is the "Field Day Special" (http://eznec.com/Amateur/Articles/Field_Day_Special.pdf). It has two elements, but can be suspended with two ropes by using spreaders made from PVC pipe or other light weight material. The advantage to this antenna over some others is that it has a unidirectional pattern which is easily and instantly reversible. With a unidirectional pattern, you get a broader beamwidth for a given amount of gain, compared to a bidirectional array. It also reduces QRM off the back, but of course you get more to the sides of the broadside direction since the beam is wider.

Sri, I prefer my Digital Signal Processing route with the two Elecraft K2
receivers.
DSP makes an ideal phaser. So no need here for a "better" analog one.
And DSP gives me a lot more tricks to reduce interference and noise.

The phase control variable resistor is linear, but the relation between
phase
difference and resistor value is very non linear!
This makes it difficult to tune to the exact phase for deep noise
cancelling.
See: http://www.pa0sim.nl/Phaser%2080%20-%2010%20meters.htm

That is why I use phase (and gain) control spreading.

What kind of wire, what kind of insulation, and how much gap between turns? It affects the self-capacitance.

I'd like to try that on the VNA, but here in the homeland of porridge, oatmeal boxes are rectangular! Also we'll soon have visitors arriving for the rest of the weekend, so if anyone in the land of cylindrical oatmeal boxes can get to it in the next couple of days, please go ahead.

I appreciate your patience and guidance.

The current 28 foot radiator is poorly located to invest too much
labor and materials for a permanent radial field. This location will
only permit 270 degrees of radials.

It seems prudent to locate the permanent field where I can get at
least 0.125 wave length radials at 160m with a minimum of 16.

Although it will complicate things by requiring additional coax and a
longer run of #6 ground wire to include it in the lightning protection
system I think it will be worth it.

That plan will also allow additional longer radials in the future.

Unfortunately, the spare (75 ohm) coax that I
have to experiment with came free from the local
TV cable company and is unmarked. It is ~0.26"
in diameter with a ~0.04" outer insulation. All
conductors are aluminum. There is an aluminum foil
wrapped around the foam insulation under the aluminum
braid. The choke is fairly close wound with approximately
3.5 turns per inch.

> I'd like to try that on the VNA, but here in the homeland of porridge,

Do you have 2 liter plastic pop bottles available
there? I'm going to re-do the experiment with one
of those as a coil form. There's an endless supply
of those coil forms from the day care center next
door.

This code argument really gets old. I passed the General 13WPM code. Bidg deal. Yeah, I like to use CW, but do I think people need to be tested on CW? Heck NO! Let's end this antiquated test. It's a modern era. If you want to learn it -fine, but don't push your old and outdated beliefs on anyone else.

I've had enough of SC in newsgroups!

Please don't answer his flaming posts. I would like for my 14 amateur radio operator girl child (who is working on her code) to be able to use newsgroups without this abuse. We should not have to put up with it either.

Copy and forward the following to abuse@earthlink.net. They should be able to identify him from the headers and their logs.

Dear Earthlink Abuse . . .

Please get this clown off of usenet. There are several hobby groups where he posts regularly his inflammatory material, often with profanities. Our kids who are in the hobby certainly don't need to be exposed to this stuff.

Thanks.

Long time internet user and parent.

And if they fail the code test they get zapped again.

Bringing back 'spark' will be good for ham radio.

5wpm ain't really learning it. I can fart 5 wpm.

Lets kick the requirement up there to between 13 and 20 wpm for all

classes. And no-codes that haven't passed it after a year get booted which

will help clean up the repeaters.

SC

m.News. EarthLink Members should use their best judgment when posting to any newsgroup. Many groups have charters, published guidelines, FAQs, or "community standards" describing what is and is not considered appropriate. Usenet can be a valuable resource if used properly. The continued posting of off-topic articles is prohibited. Commercial advertisements are off-topic in most newsgroups, especially regional groups not specifically named for such. The presence of such articles in a group is not indicative of the group's "intended" use. Please familiarize yourself with basic Usenet netiquette before posting to a newsgroup.

EarthLink considers "multiposting" to 10 or more groups within a two week sliding window to be excessive. EarthLink servers currently limit the number of allowable "cross-posts" to 9.

EarthLink Members may not cancel messages other than their own messages. A Member may cancel posts forged in that Member's name. We may cancel any postings which violate this AUP.

Very interesting.

But

Seems like those fuel canisters are just a bit on the pricey side.
And what fuel do they indeed use? Complete lack of info on that.

I see the website mentions refill stations. What kind of power do
those use? How do they work.

You don't. Use a kill file. If you don't, you have only yourself to blame.

It;s much less expensive in the long run than screwing around with everyone's
first amendment rights.

wrote:

>Seems like those fuel canisters are just a bit on the pricey side.

When I run the numbers through I get N-Gen at $1000 and Honda EU1000i
at $790. Close enough for now.

But the fuel is much different. - N-Stor130 is 130 W-h for a cost of
$450. But the Honda fuel consumption is 3.8 hours at rated
continuous duty of 900 watts. Or a 0.6 US gal tank of gas produces
3420 W-h. That's about $2.

So 130 W-h for $450 or 3420 W-h for $2.

Unless you really, really need that absolute quiet of the fuel cell or
have unusual conditions such as the space shuttle then it's a no
brainer to me.

I can see this setup being particularly useful for repeater sites
during an extended power outage. Any URLs for simple modifications.
I'm real ignorant on this kind of stuff.

Hmmm in the section titled KEEP THE GENERATOR ORIGINAL - "Larger
auxiliary tanks added to the system will create more pressure on the
inlet needle valve which may cause the inlet needle to lose its
ability to regulate the fuel flowing into the carburetor. This may
cause the crankcase engine oil to become diluted with fuel, spark plug
and spark arrestor carbon build-up, and possible external fuel leaks
which may result in fires."

Ours spell "litre" differently but I guess they're the same - 95mm or 3.75in diameter? If plastic bottles from the USA are a different size, I'll go fetch one from our local beach... you'd be amazed at what floats across.

> or use the ineraction in some way.

Why not using a single whip resonating on the CB band and then having a small switch, close to the antenna base, that inserts a capacitor in series which cancels out the inductive reactance that the whip shows on the higher frequency?

Alternately, you may tune the whip in between the CB band and 10.meters (say on 28.000 MHz) and have a switch that inserts a capacitance for 10 meters and an inductance for CB.

Looking for suggestions for a good crimp tool for installing coax connectors. It will primarily for BNC connectors on RG-174, 58 and 59 cables. Although the RG-8 cable family capability would be nice too.

I do wish to avoid being a captive customer in that brand X crimp tool only works well with brand X connectors.

And, of course, looking for the best bank for the buck.

Thanks,

Danny

Once a month or a thousand times a day? It makes a difference. I do about ten a month, and a plain old automotive crimp terminal tool ($15) works just fine. Some have been in service for ten years with nary a failure. Put a dab of RTV over the crimp and coax, then shrink some sleeving down over RTV, crimp, & coax to make a hermetically sealed connection.

Cushcraft did use fiberglass for a number of years. Delrin is used by other
antenna mfg.

I have seen oil impregnated nylons used for some large verticals.

For what it's worth, the following is the method I used in developing the W2DU current balun in 1981, that was published in QST, March 1983.

I wanted the balun to cover 80 thru 20m. I considered the worst case situation would be on 80 m with the dipole cut to resonate at mid band, 3.75 MHz. Measured impedance of my dipole centered at 3.75 MHz yielded a terminal impedance of 53 - j122 ohms at 3.50 MHz, for an impedance magnitude of 133 ohms at 66.5 degrees.

We must consider that the center conductor of the coax feed line connects to one half of the dipole, and the outer conductor to the other half of the dipole. Therefore, the outer conductor sees only one half of the total terminal impedance of the dipole, 66.5 ohms. I then considered that the choking impedance of the balun should be no less that 10 times the half-dipole impedance over the entire frequency range from 80 through 20m.

Fifty No. 73 beads satisfied that requirement with lots of margin to spare, right down to the top end of the 160m band at 2.0 MHz. Reference to Fig 21-3, Chapter 21 in Reflections shows the impedance to common mode current on the coaxial feed line throughout the designated portion of the spectrum. Fig 21-3 can be downloaded from my web page at www.w2du.com by selecting Chapter 21 from the menu.

Walt, W2DU

IF, 75 ohm BNC is okay .....for your specific application ...
then I would seriously consider the Snap-N-Seal (20.3mm) or Stirling
(19.3mm) compression connectors and tools. Note the size difference. USA
CATV operators seem to have adopted one of these 2 approaches nationally.

Connectors are available as BNC, F, RCA.

Blasphemy! The IBM 650 was the first computer
I ever programmed - in 1958 at Texas A&M.
Bi-Quinary (like an abacus) with a magnetic drum
and tons of air-conditioning to cool the hundreds
of dual triodes.

Our 2L bottles are very close to 4 inches in diameter
with about 6 inches of effective winding length. They
are very popular here for these kinds of chokes. I
just put 20 turns on one. The GDO says parallel resonance
is 14 MHz and series resonance is 28 MHz. 20 turns on
20m on a 2L pop bottle is what my rule-of-thumb says.

Whaaaaaaaaaaa!!

Have you ever sat on the toilet and tried to fart your callsign in
morse code?

You're so wound up, I bet you could fart your call at a nearly
perfect 1000Hz square wave.

SC

I have modified my Hustler 5-BTV by adding 12m and 17M - all homebrew for
about $10 1 antenna = 7 bands

A 1/8wl antenna mounted in the center of your roof will probably work better
than the 1/4 lambda antenna on the bumper.

My boss made the mod on his 2000 watt Honda. All you need is a spare gas cap. I can't go into the "mod" too much since I didn't so it myself, but I am told that it involves simply attaching the boat tank line to the gas cap after a hole is drilled in it and a connector is installed. And he states that it is easy to refill the system at the boat tank while running. Apparently the air that gets in does not really affect things since while the real tank on the generator may end up with some air in it, it still ends up with enough vacuum to continue to pull fuel after a refill.

He has run it for a week at a time before. Also the pressure has much to do wih how the modification is done and how you use the system afterwards. Honda is probably covering their butt, and for good legal reasons.

Many have done this mod, and know of the potential problems. I have not read of any. I would say that you just have to keep track of the potential problems and don't do something that would raise the fuel pressure.

And again, I do NOT own one of these generators. I have modified 2 others, which were not Honda, with direct connections to the carbs from a boat tank. No issues after hundreds of hours of use.

As a no-code, I am my club's sole source of FD points for UHF/VHF. I have beams for 2m & 70 cm, but maybe rhombics are better. From San Diego, most of my DX FD contacts are in the same place: Los Angeles. I don't really need a steerable antenna.

Impedance matching to a 700 ohm antenna seems to be a daunting task. If I used a 4:1 balun could I connect two or three independently terminated rhombics (one over the other) in parallel to the balanced side?

I also want to try a rhombic for UHF TV. True, this is not a ham project, but hamming isn't my sole electronics interest. (Probably the same with most of us.)

I also have a project for TV DX, which requires canceling out a co-channel interference source. The QRM is 11 degrees off-axis at Channel 53. This calls for yoking two antennas about 43 inches apart to create a deep null in the direction of the QRM. I did one for Channel 36 at 90-degrees off-axis and it works like a charm.

Of course:

1) With only one receiver and one antenna:
- Noise Reduction and Noise Blanker tricks as you see now implemented
in the new DSP transceivers like the Orion and the SDR1000 (all the DSP
must be in the AGC loop!).
- In DSP it is possible to make very small bandwidth CW filters.
- For better CW readability one can use binaural or panoramic reception.
- DSP makes multi notch filtering possible (SSB)
- In DSP it is possible to realize almost every AGC you can think of.
(a better AGC can improve weak signal reception)

2) with two (or more) antennas and two phase coherent receivers
- In DSP it is possible to realize the ideal phaser.
- An alternative is "effective directivity" by frequency component selection
see: http://home.plex.nl/~jmsi/Effective%20directivity%20by%20DSP.htm
(the audio samples show what is possible with it)
- True Diversity Reception, because both receivers can be made identical.
- Enhanced Stereo Reception can improve readability for CW/SSB signals.

3) and the tricks I dont know yet. I am not a DSP guru.
For example: (Blind) Source Seperation?
see: http://en.wikipedia.org/wiki/Source_separation
Rather complex stuff HI.

Don&#65533;t forget that not all DSP in the new tranceivers is well implemented.
Important is to recognize that DSP has a bright future for us.

Well, OK... but it takes a LOT of on-site work before a large rhombic can show any advantage over one or two decent long yagis. You'd need to put up four masts in precisely surveyed locations, with enough guy strength to keep four long spans of wire taut, and then terminate and match the thing.

BTDT, and succeeded, but it takes far more work than you imagine. When your club is trying to set up several stations all at the same time, you may find you don't have enough effort to do it. There's a severe risk of winding up with no VHF/UHF antennas at all. BTDT too...

And after having spent all that effort on a fixed beam, are you really prepared to risk a sporadic-E opening in a completely unanticipated direction?

>Impedance matching to a 700 ohm antenna seems to be a daunting task.
>If I used a 4:1 balun

That is actually the easy bit. You use the 4:1 balun with an old-fashioned device called a "universal stub": a half-wave section of parallel line made from a pair of old yagi elements. One end of the stub is connected to the antenna, and two clips make a moveable tapping point for the balun. Towards the far end of the stub, two more clips make a moveable shorting bar.

Detailed dimensions don't matter at all, because you're going to slide the shorting bar and the balun along the stub until you find the combination that gives minimum SWR. It takes all of five minutes.

That was the easy bit... but it's probably the ONLY easy bit of the whole project.

>could I connect two or three independently terminated rhombics (one
>over the other) in parallel to the balanced side?

Two stacked rhombics are easy to feed - connect the feedpoints by a length of open-wire, and then connect the universal stub at the mid-point. The counter-intuitive thing is that a pair of antennas that could be hundreds of feet long need to be stacked only a few feet above each other. But attempting to stack two rhombics will multiply your rigging problems by a factor MUCH larger than 2!

Having experienced a large rhombic for VHF, I'd stay with yagis.

> Danny

try to ebay search crimp tools there is usually a few companies that
sell a kit w/a ratachted crimper that has changable dies and include a
die or 2 2 dies should cover what you need sometimes the kit will
also include a few crimp lugs, which you might not need

cost for a brand new one w/2 dies cost me 25usd they will crimp
any standard connector that mates w/the standard dies

if you only need to make one or 2 radio shack and simular places have
crimp tools that are either plier type or that look like a ratached
tool but aren't actually ratached at radioshack you'll sometimes pay
close to what a ratached unit cost from above their plier looking
one is pretty cheep

if you don't make many they do sell connectors that don't need crimpn'

good luck

1654. Possible NEC2 bug

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-29 12:21:09 UTC
From: neok <n5b4az@yahoo.com>
Message-ID: <1162124469.902060.189230@k70g2000cwa.googlegroups.com>
Source record: 50228

Hi,

I believe I have come across a possible bug in the original
NEC2 (nec2dx.f) program. It shows up in nec2c, my translation
of NEC2 from FORTRAN to C, as a segmentation fault when
running in Linux. In the original nec2dx.f it shows up as
an Array bounds violation fault if compiled with
gfortan -fbounds-check. In both cases of course the
programs crash. This happens when an input file specifying
a wire segment in contact with a patch and with the extended
thin-wire kernel (EK card) enabled:

```
CM --- NEC2 Input File created by xnec2c 0.9-beta ---
CE --- End Comments ---
GW 1 8 0.0 0.0 0.0 0.0 0.0 1.0 .003
SM 3 3 0.5 0.5 0.0 0.5 -0.5 0.0 0.0
SC 0 0 -0.5 -0.5 0.0 0.0 0.0 0.0 0.0
GE 0 0 0 0 0 0 0 0 0
EX 0 1 1 0 1.0 0.0 0.0 0.0 0.0 0.0
EK 0
FR 0 11 0 0 50.0 5.0 0.0 0.0 0.0 0.0
XQ 0 0 0 0 0 0 0 0 0 0
EN 0 0 0 0 0 0 0 0 0 0
```

The fault is due to an "illegal" value in the connections array
ICON2 where ICON2(1) in subroutine CMWW has a value of 10001.
This signals a connection of wire segment 1 to a patch and this
value is later used as an index to ICON2 itself causing an array
bounds violation, since ICON2 is dimensioned as 2*MAXSEG and
MAXSEG=1500 in this NEC2 version.

I don't think I am qualified enough to fix this bug so I wonder
if there is still an "official" maintainer of NEC2 and whether
it is possible to contact him with the above bug report.

Source record: 50230

You can solve that yourself.

Get out your amateur radio handbook and check the resistance of #16 AWG per 1000 feet. Multiply that by 0.3.

Get out your SGC specification and find out the current being drawn while it is tuning.

Use Ohm's law to calculate the voltage drop. Subtract that from 13.8. The answer is the voltage at the SGC.

/s/ DD

I'm not being facetious. I'm teaching.

Depends on how much current you are drawing.

Quoting from my SG-230 manual: "SGC does not recommend
installing the Smartuner more than 100 feet from the
transmitter ..."

300 ft. of stranded #16 has a resistance of about 1.3
ohms at 20 degrees C. My SG-230 draws about one amp.

I am considering Roy W7EL's FD Special, published in QST in 1984. For
20M, it is about 32 feet long and has two elements separated with about
8 feet lengths of PVC tubing on each end. The elements are 300 ohm twin
lead.
It is a directional antenna. I wonder how difficult it would be to
reverse directionality?

I am considering re-configuring it for 17 meters.
What do you think...given the nadir of the sunspot cycle. Which is the
better band? (I am aiming this one approx NW from Ohio.)

And, yes, Father Owen, I'll consider velocity, etc. this time :)

John
AB8O

PS
The G5RV I recently built has Z= 86 + j22 at 7270 KHz and Z = 82 -j41 at
14000 KHz. SWR is a little higher than expected but OK.
Aren't antenna bridges cool?

I've been able to mail order most any electrical part from Mouser. No
minimum order. And it puts you on the list for their huge catalog.

17 m is a great band for ragchewing. Seems to run at a much slower
pace than 20. Here in NJ it is open most days to Europe. I think
you'd be happy with it, but in my case I find I have my beam NE 90 %
of the time.

Can't you see you've won, Mark? It's all over. You've made us understand the genius that you are. The mere fact that you are the most intelligent one here should surely be enough to cause you to step aside and let us imbeciles argue amongst ourselves.

Removing the code requirement at this late date would do little to
increase the number of hams applying for a license. At one time,
possibly 30 years ago it would have made sense to replace the code test
with one that emphasizes skills that actually have a use in the real
world. Sadly, I think that there is little that can be done to attract
younger hams into the hobby. There are just too many license-free ways
of communicating with people from around the world.

but it can help retain those we get and encourage them into intagrate
into the ARs as opposed to being driven out by such as SC

How would retaining the code requirement help to retain those you do
get. I do not understand.

obviously you do not understand since the opisite was said ending code
tsting could help retain the new hams

I see that you real as well as you spell, which is not very good. I
was responding to the following: "but it can help retain those we get
".
```

I "real"? indeed I see what you are responding to but you clearly
can't read the sentence since neither of the preceeding poster is
tlaking about reatining code testing
and neither he 2 yet futher in the tree were talking and code testing
```

at all

the only one that thinks the poster are sufggesting code testing will
retain anything is you and where you get is beyond me

1677. random wire auto tuner vs 4:1 Balun

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-29 21:18:07 UTC
From: Va3mrj <dbjohnson@rogers.com>
Message-ID: <1162156687.590406.3270@i42g2000cwa.googlegroups.com>
Source record: 50251

I have used an SGC 230 to tune a eandom long wire with great results but it died and I installed a 4:1 balun and now us the internal 50 ohm tuner in my Icom IC 746. It tunes the long wire the same but is it as efficient as the SGC?

I plan on putting up a flagpole antennae and want to use the 4:1 balun, one side to the ground radials and the other to the flagpole. Appreiate any advice in this project.

1678. Re: 10 meter mobile antenna

It would not be mounted on the bumper.
My thinking is that since the first 1/3 of an antenna does the most
radiating, get it as far away from any metal (broadside) that you can.
It would be mounted in a stake-hole (one of the 4 square holes in each
corner of the truck bed.
Joe

If Slow Code left, I would miss him.

I do not agree with him most of the time. As a matter of fact, he is dead wrong a lot of the time.

At least he stands up for what he believes in.

I myself, do not think that every ham should have to be able to send/copy code at 20wpm no more that I think they should be tested on psk,rtty, slow scan tv. etc.

Some people have a passion for code and some have a passion for other modes. I use them all from time to time, and to be honest, after I move next year, I am going to work on my code a bit more when I have the time to do so.

However, I will still give him a hard time about his ranting. After all I have not heard anyone tell him that he is not a real ham because he does not have psk nailed down..HI HI

A quick check of the NEC 2 manual indicates the SC card
does not appear to be supported. It does not run with
my NEC2 program, but works fine in NEC4.

I am sure Gerry Burke at LLNL would be glad to help you.

Regards,

Frank

Amateur Radio is about much more than "communicating with people from around the world".

Amateur Radio is about LEARNING !!! LEARNING some physics, learning about sunspots, learning about antennas, learning about propagation, learning about some electronics, learning about digital communication techniques, learning about VHF propagation, learning about microwaves, learning about wide band tv systems, learning about narrow band tv systems, learning about ... [you complete the phrase].

If you just want to talk around the world, use CB. If you just want to talk around town, use FRS. If you want to LEARN about radio become an Amateur Radio operator [make a commitment to LEARN].

You forgot the most important part....
How about helping out the rest of the world in emergencies?

After any disaster, the first comunications out of the effected area comes
from hams. NOHA gets a lot of there hurricane information from hams in the
affected area. Sometimes while the ham op is in the middle of it.

When all else fails...we are there!!!!
Been there, done that

I was part of the big RRAP CW and anti-ARRL fights of the late 90's up
until restructuring went into effect, then my posting tapered off. I'll
disappear again once the FCC totally kills off ham radio by eliminating
the code requirement. When that happens, I'll wear a strip of black
electricians tape around my arm in memorial and observe twenty-four hours
of radio silence in memory of a once proud service.

Rest in Peace, Ham Radio. You were a good and faithful friend.

You don't cut wood for winter, forage the woods for berries, turn the crank on a model T, build spears to kill a deer, wash clothes in a river, or make candles to light the night, why would you want to make your own stamps? Just collect them, no CW test required.

Try not to drool on the sticky side.

Message-ID: <12kakbm5t8sgj9f@corp.supernews.com>
Source record: 50270

The small Honda generator is exceptionally quiet and produces good quality AC. Used mine during a long power outage with the generator in the garage (with the door up). The noise of the generator of my nearest neighbor (who is a good 400 meters away) was quite noticeable when standing next to the little Honda. Just a data point.

Thanks for the detailed, thoughtful reply. I need to learn more about matching, as the term "universal stub" is a new one to me. (I know of stubs only for their value as coaxial tuned traps.) However, a matching task that takes only five minutes has built-in appeal and WILL be pursued!

If I do a rhombic, I think it will be for 70 cm first, since the size is easier to manage. The FD location includes a baseball backstop which will serve as a tiepoint for the near end of the rhombic; if I erect and guy a single pole off in the desired direction, I can run lines from it to the baseball backstop and, from these lines, suspend the antenna. Since this is all play and no work, the complexity is of no concern. If I get it built and tested before field day, it will be no more time-consuming to set up than a yagi.

Er ... what about polarization? The HF rhombic is horizontally polarized, I think. If I do that at 70 cm, I'll be cross-polarized with the rest of the FM voice world, won't I? I should rotate the whole thing 90 degrees, eh?

An aside: When I was a young sailor (USN), I was stationed at a communications receiving site in the Philippines. We had over a square mile of antennas, including dozens of HF rhombics. We could hear anything.

I have an SDR-1000, not really excited with the way it works. Especially the noise blankers. Not sure if its the latest SVN or what but the noise blankers just dont seem to do the job.
I agree with the filtering though. Its better than many rigs I have heard. I recently added a roofing filter to an "old" Kenwood 930 and it did make a difference. I noticed the difference in the CQWW contest that just completed. One night I used the 930 the other the SDR 1000. Both receivers seemed to work as well as the other. All was going well until the antenna quit on me. This my friend is a whole other story. Shortened verticals are not the answer.
Guess I will call Force 12 in the morning and see what they can offer me for a 75/80 meter antenna.

Some good ideas, thanks.
Uni or Bi directional are both OK. I can get about 55ft in height. I just want to use the space I have as effectively as I can for a 17m antenna. I am OK for quite a few bands with my existing antennas but cant put up my tower because of the visual impact! I will look at some of the antennas you have suggested.

Regarding the various DSP and Filtering comments.

The ANC-4 keeps most of the noise crap from ever getting into the radio in the first place. Local manmade noise is phase canceled BEFORE the first rf connector INTO the rig.

This makes the DSP/Filter functions much more effective in that they have a less severe noise environment to deal with.

I use an ANC-4 with an ICOM 756 Pro III. I wouldn't be without the ANC-4.

Not meaning to give a short answer, but no "tuner" is 'efficient'. Of you
may already know that :). I would theorize (sic?) that the SGC would be
more "efficient" simply because of larger inductors and more capacity;
sometimes, bigger IS better! >:) Same way a large bugcatcher is more
efficient than a hamstick!

Perhaps, someone else has more.....?

Good luck.

I once saw a 102" whip on a motor home that had literally been wound into a
4 " dia coil about half way up! It looked like one of those CB "big coil"
trucker antennas except it was all in one piece. I can only surmise that he
heated it and wound it around some sort of form. It shortened the thing down
to less that 5 feet. But, then, wouldn't that take the temper out of the
steel and make it flop over the next time it was hit? There was also no
evidence of heating, either; it looked like it had been formed at the
beginning of its life. Anybody ever see anyone do this before. If so, how
was it done?

To each his own, but I don't agree with the "bottom" of the antenna doing the radiating. :) The bottom, *if* I understand it correctly--and I am not here to prove anything or start a flame war (I ain't got time for that ;))--is the voltage portion, the top would be the current (RF) portion. Witness what happens if you grab an antenna (dipole. The current at the ends can reach levels to produce serious burns! Grab a mobile antenna below the loading coil while transmitting. You won't feel a thing! Grab it at or above the coil, it will burn the hell out of you (X-numbers of milliamps of RF current). The next thing is, IMHO, if your antenna is radiating from the bottom, WHY would you even NEED the rest of the antenna? LOL! Next there's those pesky ground proximities that tend to "grab" a signal and just spoil everything.

Now I am not trying to start a war, prove anyone wrong, annoy anyone, or engage in a "I'm-smarter-than-you-and-I'm-not-gonna-yield" etc, etc. I'll yield because it is 1) not important to me) and 2) cuz I ain't got time to get into a theory war today! ;) But, I am just of the opinion that the RF is where the thing will burn the crap out of you if you grab it!!! I've been burnt plenty of times, and it ain't pleasant!!!

HUH? Morse is Morse regardless if it is done with a key, a Navy ship's lamp, a flashlight, or it is pecked out with a hammer or stick!! ... --- ...! It DID save someone's life and a sinking boat...well, maybe not the boat!;)

If someone taps out code, it may not be Continuous Wave Telegraphy, but it is still the same principle.

Nope, for a 1/4WL mobile antenna, the feedpoint is the
high current, low voltage point. The tip top is the
low current, high voltage point. The thing that tends
to bite us is the high voltage.

Consider that the top portion of a mobile antenna can
be a low-radiation top hat while the bottom of the
antenna (high current section) is radiating very well.

Makes absolute sense to me. What we need is for somebody to invent
synthetic gasoline that doesn't produce CO2 and is willing to sell it
for a dollar or two a gallon.

I agree - learning something about amateur radio is a requirement for
passing the test. The real question is what kinds of knowlege about
amateur radio should be required of prospective hams before giving them
a license. It would seem to me that testing a prospective ham for
knowlege of how radios operate, how to set up a station properly and
how to operate the equipment safely would be a primary concern. Next
the ham should be able to demonstrate an ability to use the equipment
to communicate in an efficient and courteous manner in a mode that is
widely used. Voice is hands down the most frequently used mode of
communication. Additionally, a knowlege of how to communicate via
radio using voice would be a big help when trying to make contact
during an emergency with professional rescue groups. Having the
prospective ham learn morse code would not provide him with a skill
that has any real world use.

I should have looked more carefully. I found it on page 30
under details for the SP card. Strange, but my NEC-Win Pro
does not recognize SC. When I attempt to run your code
I get the following error message in the NEC output file:
"NUMBER OF WIRE SEGMENTS AND SURFACE
PATCHES EXCEEDS DIMENSION LIMIT".

It's not code requirements or tests that is keeping (and driving) good
people out of ham radio, and away from lists like these, it's
psychopaths like SC and the idiots that feed him. This WAS about real
issues, and about technology (I hit this cesspool from the antennas
list), but it is not now.
Thanks to the crap fron SC, and from the idiots that feed this Troll,
I'm leaving. On real lists, s--t pots like him are kicked out. On
usenets, the only way is to quit feeding his ego, but, unfortunately,
he is not the only idiot here.
Bye-Bill

I can work the UK on 40 phone now without going split. They can use 7040-7200 now. OTOH, who knows when the broadcasters will ever move?

It's a complete crock about protecting the DX. The answer for ragchewers has always been to use a band that isn't open to where you want to be protected from, i.e. don't ragchew on an open band unless you want DX (meaning in this case US hams) to ask to join the QSO (some actually like it when that happens, you know). It's not really hard for them to find a band that isn't open to the US.

KH2D and I used to chat on a dead band; 10 meters. Then someone from
Africa would break in for a QSO

1739. Re: Horizontal Coaxial Dipole?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-10-30 23:47:02 UTC
From: lu6etj <lu6etj@gmail.com>
Message-ID: <1162252022.830669.219080@m73g2000cwd.googlegroups.com>
Source record: 50213

Hi Cecil

If I have understood well your question, I think that the "Resonant Feed dipole" (ARRL Handbook. 1996, page 20-17) is so much similar to the clasical sleeve antenna. See in http://www.io.com/~n5fc/rfd.htm a description.

Decoupling with his approach (choke) to the transmission line is poor due high end Z.

I have modified it replacing coaxial choke transforming it in a coil (less turns) made with the same coaxial but parallel tuned with a condenser making these turns resonate (both terminals of condenser are connected on the braid).

It is a good kite antennna (I am flying today with a Rokaku kite), and a good solution for a good "windows in" dipole, without any tunner neither earth connection...

Best Regards

Miguel Ghezzi (LU 6ETJ)

Source record: 50134

I have 2 wire antennas that I am thinking about putting up..

#1 A long wire with the shield of the coax grounded to the tower at the feed point with the center of the coax connected to a long wire cut for mid band on 160.

#2 a normal dipole cut for mid band 160.

What are the pros and cons of each?

Max output is 100 watts
MFJ deluxe versa tuner II
Coax fed
Air wound choke ...possible or if needed..
I do have an antenna analyzer for tuneing.

Just a (long wire) connected to the center of the coax, cut to resonate at
160 meters (about 130' if my memory is correct) in other words, one side of
a normal dipole.

If you do that, the outside of the coax becomes the other half of the
dipole. Be prepared for some interesting effects in the shack.

Joe,

Getting detail from you is like drawing teeth. I suppose part of the
learning process is learning the factors that are relevant to the
situation.

You did say you would connect the outer of the coax to the tower....
where abouts? Near ground, somewhere else? This makes a difference.

Fundamentally, you are probably on the wrong track connecting a half
wave wire to the centre of the coax... but that depends on what you
connect to the other side of the end of the coax.

If in fact you effectively ground the end of the coax at the outer,
and have the centre connected to the end of your half wave wire, you
will have a very high VSWR on the coax, exacerbating the loss it
already has, and the magnitude of that loss depends on things that you
haven't described... but it can be huge.

If you were to chose the worst length of a wire to connect to a
substantial length of coax inner in that scenario, it is probably a
half wave. What were / are you trying to achieve?

Owen

Have a 100 foot roll(approx) of used coax cable which has no markings
printed on it.
Can anyone tell me how I can work out what it might be ? e.g. 75 ohm or
50 ohm or ?
Going by the size it looks similar to 50 ohm but I'm not sure.

Any suggestions would be appreciated.

You can't even get behind the steering wheel. The state took your
drivers license away 3 years ago after you hit that Monte Carlo while
you were drunk on cheap liquor. That was when your wife left you also.
I remember it all. I know who you are!

You didn't mention what you have to make measurements with. The simplest way to make a quick estimate is probably to guess at the velocity factor first: solid polyethylene is about 0.66, and foam polyethylene is roughly 0.78. The impedance in ohms is 60*velocity factor*ln(D/d), where ln is the natural logarithm, and D/d is the ratio of inner to outer conductor diameters. So for solid polyethylene dielectric, D/d is about 3.5 for 50 ohm line, and about 6.2 for 72-75 ohm line. Even for fairly small line, it's not difficult to tell by just looking at it. It's also possible to measure the capacitance of the lenth of line and the electrical length in nanoseconds, and calculate the impedance from those two. If you can measure RF impedance, measure the line with the far end open, and with it shorted, and take the square root of the product of those two.

Cheers,
Tom

Message-ID: <bDG1h.462$Wn4.377@newsfe12.lga>
Source record: 50145

The easiest antenna is Inverted Vee, dipole cut for the middle of the band where you want to operate, one support, fed with coax (50 ohms), no need to match anything, just trim the ends to resonate around 1840. Ends can be zig-zagged to fit the space. With good ground it accentuates the vertical polarization and low angle component.

Simple and it works. Got one here in a tree.

About coax impedance,

When you just have a (VHF) transmitter with 50 Ohm VSWR meter and
external dummy load, you can do the following:

Check whether the insulation (between inner and outer conductor) is
solid or not (may be foam).
Check whether the insulation (between inner and outer conductor) melts
(changes color to transparent) at relative low temperature.

If solid, the velocity factor is about 0.66, when foam, it will be
about 0.79..0.84
If it melts at relative low temperature it is very likely Polyethyleen
(PE) insulation, if not, it is PTFE (Teflon).

Based on your transmission frequency and the velocity factor, cut an
electrically quarter wave. Terminate the cable with the 50 Ohms dummy
load and connect the cable to the VSWR meter. Measure the VSWR of the
cable/dummy load combination.

When VSWR is almost one, you can be sure it is 50 Ohms cable. When it
is about 2.2, it will be 75 Ohms cable. When it has VSWR close to 3.5,
it is probably 93 Ohms cable. This is based on: Zload*Zinput = Zcalbe^2
for a quarter wave line.

When these measurements matches the mechanical identification of Tom's
posting, you can be very sure about the impedance of the cable.

Best Regards,

Wim

About "end fed" or "center fed" 160m halve wave antenna.

I assume that you will have a halve wave for both options and it is a
single band antenna.

The halve wave dipole will probably work well. I would insert a current
mode balun (based on low frequency ferrite), to reduce common mode
current. The VSWR will be that low, that after tuning in the shack the
cable loss will be negligible.

I have doubts about the end fed option. The halve wave end fed wire
will show a VSWR of about 30..40 to your coaxial cable (impedance in
the kOhms range). Of course you can correct this with the tuner in
shack, but I believe, depending on the cable length, most power will be
lost as heat in the cable.

If you still prefer this option, you may do part of the tuning at the
mast. You could build, for example a 50 Ohms to 1 kOhm transformer.
This will not give perfect match, but the VSWR will be in a range that
it can be tuned inside the shack without significant cable loss.

I would not reduce the length of the end fed wire to a quarter wave
(gives better match), because of high ground current (with associated
loss).

I hope this will help you making the best choice.

Normal dipole. You need all the height you can get. With the long wire of course it is dependent on the physical configuration as to whether you get horizontal or vertical radiation, and you need a ground for it that could be considerable. In fact MUST be considerable to reduce losses in the earth.
I had an inverted L up last year, 40 feet vertical and 80 ft mostly horizontal with 16 radials of about 50 ft, some longer. My inverted vee at 50 feet worked just as good. I almost never could see any difference, and the inv vee is trivial to feed.

Sure, attach it to a dummy load and see if you get a perfect 1:1 swr.
There are lots of other ways but this is simplest.

Why not turn your tower into an inverted-L and
gamma feed it? The tower plus the wire connected
at the top would need to be about 130 feet.

Otherwise, go with the dipole. The above #1 antenna,
as described without modifications, would not work
very well.

If it has a solid center conductor, it is almost certainly 75 Ohm. The only exception I can think of is some weird version of RG58.

I do have a bunch of older RG-58 with solid center conductor, and pretty much all the HP BNC patch cables I've seen the insides of have a solid center. I believe the various semi-official versions (RG-58/U, RG-58A/U, RG-58B/U and RG-58C/U) tell whether the center is supposed to be solid or stranded, but that seems to have become bastardized. A quick Google search for RG58A yields cables with both solid and stranded centers. How about Belden 9913? Of course, the construction of that line is "different" enough that it would be hard to mistake it for something else, and I assume the poster would have mentioned the strange construction. Also, you're likely to find a solid center in higher impedance line like RG62/U, and you're likely to find stranded center on 75 ohm line (like RG-11/U, and others). And of course for some surplus custom line, all bets are off about both stranding and impedance!

Cheers,
Tom

Well, I was going to avoid this, but when you chimed in Tom, couldn't help myself. In turn, I have a large helping of a Times Wire and Cable RG-8 size 50 Ohm coax with a solid inner conductor. Don't remember their nomenclature for it but it's a real bear getting "N" connectors onto it..

On april 1st, I will host the 1st annual group members convention in Intercourse, PA. Bring you boat anchors and plenty of lube. You will need the lube for the different circle jerk meetings. You can swap spit, your fat wives, boat anchors, nerdy facts, geeky stories and even your sister! The cost for admission is a pair of your mamas soiled panties. We will have testicle sack races, foreskin tug of war, and don't forget sword fighting. At night we can sit around the camp fire and reminese about Hal Turner, Bill Cooper, and all of the other losers of shortwave gone by. On April 2nd we are going to have a shortwave DXing contest. The winner will be crowned with a crown made up of old radio tubes and knobs. Then we will have a knob polishing contest. The prize winner for that gets a free trip to San Fan., CA.
There will be a dress code. You must have a pocket protector, black polyester pants, white short sleave shirt, white socks, black shoes and a white hanky. No exceptions. To make your reservation call 1-800-565-6656.

Thanks everyone.
I will be changeing my QTH next summer but was trying to get up something for 160.
My back lot has enough room (and trees) to place 1 side of the dipole from my tower. It would need to have a bend in it to make it fit but it is possible.
The front of the house is a problem, theres nothing there but the power lines...
Is it possible to put a slinkie on just one side of the dipole or would I need to make both sides exactly the same?
I could wrap a lot of wire around something (with the loops spaced apart a bit) on one or both sides of the dipole.
I am just trying to get up something for 160 for 9 months or so.

The fan dipole I have up now is about 66 feet long (each side from the tower) <<<<66<<<<tower>>>>66>>>>.

I do not know what would happen if I ran the 160m dipole 70 feet or so and bent the ends in the same direction (towards the back yard)

My back yard is 120' by75' (the fan dipole I have up is at an angle) The tower (feed point) is in the middle of the 120'side 75' from the back of the lot.

Any ideas? It will only be up for 9 months or so...
Thanks
Joe

I don't recall seeing it anywhere, but is there any problem with using some left over guy wire (3/16 EHS) to go from the tower to a ground rod at the base of a tower. Planning on going to about 60 feet with Rohn 25 and will probably use a ground rod at the tower and maybe one at each of the guy points. Just seems to me that if the correct clamps are used the wires and tower would be the same material and not have a galvonic reaction.

I agree, unless you do a lot of connectors soldering is the best way to go.
It doesnt take long at all to get proficent at making good soldered on
connections. Crimp on connections can look good but be awful. A few years a
go a guy installed some equipment at work that had over 30 BNC connections.
He got an award for the installation and I got 50 hrs of overtime for going
back and really making it work right. Most of the work was repairing the
crimp on BNC connectors.. The problem with the connections, he used a crimp
tool that was about worn out.

AMP makes such, but be forwarned that their
connectors, and tool aint cheap! But, they work
great . They also make them for Pl259's . They
quite proud of their products.

Thank you for the response, however, because others have suggested
soldering I feel an explanation may be in order.

I have been installing soldered coax connectors for more than fifty
years and feel I was pretty good at it, however, with advancing years
I have lost considerable motor skills and can not hold a soldering
iron (or anything else) very steady. My problem, at the moment, is
trying to make up some BNC connectors using RG-174. Although crimp on
connecters may not be the best choice, for me they appear to be a
viable option. Hence my inquiry as to what would be a good choice in
crimp on tools.

1804. two topics one OT and one not

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-01 03:42:12 UTC
From: jawod <jawod@fuse.net>
Message-ID: <def5d$454817ff$4831cf4b$12383@FUSE.NET>
Source record: 50078

I recently posted regarding an antenna that Roy, W7EL designed back in
the 80's for backpacking (FD Special: directional array). I was a
little disappointed at no response but such is life.

Any thoughts as to whether this is a good approach to a home QTH antenna?

I was considering reconfiguring it for 17 meters and trying EZNEC for
the first time (if I can get the program to work on my new MacBook).

The antenna (20M version) consists of two elements separated by about 8
feet and the ends connected to a PVC pipe for support on each end
---<[======]>---

The antenna is 300 ohm twin lead and the feedpoint is in the center with
a 1/2 twist phasing line to the other element. 330 pF caps are used at
the feedpoint for matching.

I asked whether it might not be too difficult to reverse directionality.
(there's an article in QEX about that, in general, this month).

Any thoughts are appreciated.

2nd (OT) comment:
Compared to monitoring HF ham bands back in the 70's, is it true that
more QSOs are in nets now than individual QSOs?

I am very aware of the aging of hams (myself included)...many
conversations concerning healthcare interventions.

My impression is that the HF ham bands are LESS crowded than previously
(and this seems to conflict with what I am reading in ARRL, etc.)

thanks,

John
AB8O

That's definitely a good reason, and the kind I appreciate more and more as time goes by. I'm sure it won't be long before I'm in the same boat, so I'll pay attention to the tool suggestions too.

Sorry, I missed the first posting.

It's a simple matter to reverse the directionality. Self-extracting ZIP file http://eznec.com/misc/fdsp~.exe contains a program for designing the antenna and a text file FDSP.txt with extensive notes including information on how to reverse it. (The original article is at http://eznec.com/Amateur/Articles/Field_Day_Special.pdf. See the added notes at the end.)

It's a difficult antenna to model with EZNEC, because there's no direct way to account for the effect of the dielectric material between conductors in the twinlead, and this has a significant effect on performance. The best approach is to use the design program (which does account for the dielectric) to tell you what the current ratio is, then model a simple, unfolded 2 element array with that ratio. The example file FDSP.ez which comes with EZNEC can easily be modified to suit the purpose. See the accompanying Antenna Notes file for more information.

This is very likely to do with the bug I reported. Gerry has now
verified
it is a bug and provided me with a fix. I don't know what he intends to
do now to notify vendors and users but this bug never showed all these
years because the input that causes it (wire connected to a patch and
EK
card used) is not a useful case.

Interesting, thanks Neoklis. Since NEC 4 ignores the EK card I guess
it explains why it runs without error.

That obviously makes you a real programmer. But it is the hard way to do things, especially if you find a mistake and need to insert a new instruction somewhere. All of the target addresses after the inserted instruction change, and you have to go back and correct all references to those later instructions, as well as some references to earlier instructions (relative jump instructions change value). I much prefer the "luxury" of an assembler, because it will do all of that stuff for you.

To stay on topic, I'd probably better mention that Michael Jackson's first chimp was named "Bubbles" and that the chimp and Michael would dress alike wherever they went. The chimp later moved away to Chassell, Michigan and started a consulting business. Michael took up with another chimp named Max, thereby sending Bubbles into a jealous rage. Bubbles has been acting his anger out in Usenet's rrap ever since. He can be recognized easily, because chimps don't spell or type all that well, and his posts stick out like a sore thumb. He tries to cover it up by claiming to be dyslexic, but everyone recognizes a chimp's typing when they see it, and they know that the poster is really Bubbles.

I have felt there is less QRM now days too. When I consider my own circumstances, I never had the Technical abilities I have now. I think my TenTec Jupiter with its accurate tuning and variable bandwidth makes a big difference. I have noted that most QSO's take place on 1 mhz increments, which results in informal "channelizing" of the bands. I am usually exactly on the other fellows frequency. While there are probably more high power stations than ever, the rigs are cleaner in general. I would be embarrassed to key up some of the unstable HB rigs of the past. I think a higher percentage of the Ham population is satisfied with a decent antenna and a clean 100 watt rig. Rigs that enforce 50 ohm transmission lines have reduced interference too.

We are making better use of the allocated Spectrum.

Take a dipole's worth of wire. Run it vertical for as far as you can, then horizontal. Feed it with a quarter wave of ladder line at the bottom end. The ground isn't too important....a 3/8" copper pipe driven in should do it. Tune the line as balanced. Cut it for the part of the band you use the most.

The higher you bend it, the better. Halfway is probably a good compromise between DX needs and local working.

It's really not hard to design, build, or set up. I used one at Field Day this year as I have for the past 20 or so(*), and I had ones for 20 and 15 at home for quite a few years. One Field Day many years ago when the kids were little and we "car camped" with friends, we put FD Special antennas for 40, 20, and 15 up about 90 feet with a slingshot. Were the top of our class that year. Quite a few have been built for various bands and reports I've gotten is that they work as designed. Have fun!

(*) For a non-rotatable Field Day antenna from this location, the pattern is just about ideal. It's wide enough to cover most of the U.S. and without any significant power being wasted to the rear. I use only one feedline on Field Day since there's no real need to switch the direction.

So you finally admit that you're Bubbles, eh?

> stil avoiding you Progaming gaff tell do you take advice on uhow to

Bubbles, the word you want is spelled "gaffe" (I hope). If you really
mean "gaff," why then you are speaking of either sailing gear or cross

dressing garments (see http://www.samiscloset.com/gaffs.asp). As to programming, why I have forgotten more about it than you have yet to learn.

> handle your gaff from Kerry? it sure looks like it

John Kerry has never sent me a gaff, and I'm puzzled as to why you think that he is a cross dresser?

Hi All:
My recommendation is to use the tool made by the company that makes your connector. They know what works best with their connectors. Having said that, all BNC's for RG174 and RG58 are almost the same and the inexpensive tool made by Amphonal and others work very well. It will cost you from $50 to $70 but it will work OK. They take interchangeable dies and you can use the dies from almost any similar looking tool in any of the handles. Type N's for RG-213 work well in crimp and I've think that Amphonal's RFX series crimp on PL259 (available for 213 and 58 with crimp braid and solder center conductor) works well and a tool with interchangeable dies makes going all crimp a little cheaper.
About 20 years ago I quit using as much as possible solder on connectors. I find a well assembled crimp better in all respects than an average solder on connector. I've used a lot of them too. I've worked for years in the High Energy Physics world and have installed 1000's of connectors on coax. As an example one small experiment we did had 9 miles of RG-213 with crimp on connectors and 1 miles of RG174 cut into 2' pieces with connectors crimped on. Not one failure do to connectors in the 4 years the experiment ran. The secret is to follow the manufactures directions EXACTLY and take care not to nick the braid or center conductor when striping the coax.

I'd avoid it. The conductivity of steel (stainless?) guy wire is much
lower than copper, maybe 40 times lower, so your 3/16th EHS is maybe
something like 20 gauge copper equivalent.

Jerry,

It's the high-voltage bits that bite you because your skin resistance
is so high it takes some substantial voltage to drive a noticable
current through you, but it doesn't take much current to give you a
nasty burn. The high-current parts of the antenna don't have enough
voltage to burn you.

1843. N1LO HF mobile antenna part question

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-02 05:23:27 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns986EDA36C997Espectrumhogstarbandn@198.186.192.196>
Source record: 50117

I'm planning on building the N1LO HF mobile antenna as outlined at:

http://www.qsl.net/n1lo/mobilhf.pdf

As part of the coil fabrication, he describes "gromment strips" used to hold the coil together. A McMaster-Carr part number 85085K8 is referenced for the grommet strip. The McMaster-Carr website does not show this part number as a grommet strip, but rather as a nylon edge trim, and not serrated. In fact, a search of the McMaster site does not reveal anything described as the "grommet strip".

I did manage to find grommet strips listed at other sites, but since I wish to place an order for other items from McMaster, I'd like to get the grommet strips from them too.

Can anyone shed any light on this?

Tnx

Ed K7AAT

Hello Joe!

One easy thing that you might try, is to slope a 1/4-wave wire from the
top of your tower, connecting your coax to the wire, and coax shield to
the tower at the feedpoint, this way your tower will be the "other leg"
of the dipiole, or a "counterpoise". Then just trim the 1/4-wave wire
for swr.

Crap like this is why I haven't gone for a ham license. I've worked in
real broadcast radio and thought about taking the amateur test, but I
have no desire to be in a hobby filled with childish old geezers.

Now careful there who you call an old geezer. I'm the same age as Winnie the Poo, and I too take umbrage with all the childish crud foisted upon the newsgroups by SC and others of his ilk. I'd be willing to place a wager that the SOB (Not to be implied that his name is Sweet Old Bill), is under 50 years of age and more likely, under 30. Certainly his mental age (and capacity) is less than any of my 6 great grandchildren and one of those is still in the oven.

Give the ham ticket another go. It's a great hobby despite the best efforts of that little publishing company in Connecticut, the QCWA and a few disgruntled idiots that have to have some reason to think themselves better than others even if it's only through an obsolete mechanical skill likely teachable to a reasonably smart chimpanzee.

Thanks for the reply. The problem was solved when I

1) Ran #12 wire through the 2nd-story window sill and down to a 10 feet long copper clad ground rod. The length of the wire run is about 15 feet. While this may seem to be an obvious step, at my previous QTH the use of an earth ground made RF feedback problems worse on some bands.

2) Installed an Amidon FT-240-77 ferrite toroid as a common-mode choke (11 turns) in the Orion's DC power supply cable and located about 18" from the Orion. I am using an Astron RS-35A linear power supply (the fan on the Ten-Tec switching PS was too noisy). The cable run between the power supply and the Orion is somewhat lengthy because the Orion is connected to an MFJ-1129 multi-outlet strip.

Wouldnt be that hard to do, You can retemper the steel if it gets soft and the discoloring will buff off.
tempering metal takes some specific knowledge and experience. Ive done it to tools and had some success but I have also made them to brittle and they break.

Of course it may have been one of those big coil antennas

I have never tried the latter method but I suspect you may have some of the
same problems as with first because the dielectric properties of coax outer
jacket really stinks at rf. What are the limits on the diameter of your
sleeve?

The ARRL Antenna Book says that works if the tower is 1/4WL
tall or taller. A 1/4WL tower on 160m would be about 130 feet
tall. If the tower is less than 1/4WL tall, it seems to become
the major radiating portion of the antenna. I just modeled a
33 foot tower and a 100 foot wire on 1.9 MHz. That total length
is just about 1/4WL and winds up looking something like a gamma
fed inverted-L. The feedpoint impedance at the top of the tower
is low at ~8 ohms.

Such an antenna has a 50 ohm feedpoint impedance somewhere
along that horizontal wire. In my 33'-101' version above, the
50 ohm feedpoint is about 40' from the open end of the 100' wire.
And, of course, the feedpoint currents are unbalanced.

```
100' total
+-----------------------FP---------------
| 60' 50 ohm 40'
|
|33' tower
|
|
+-----GND
```

A friend of mine is shunt feeding his 80 foot tower on
75 meters. He asked me if he could install another shorter (35 ft)
inductively loaded vertical 1/4 wave away from the tower
and phase them to favor Europe. I was not sure. Will two unequal
physically, but resonate, vertical antennas have the same low angle of
radiation as two that are equal in size? My thought is that they may
have some kind of directivity, but not as low an angle as equal ones.
Yes, there will be a good system of ground radials.

John / K1BXI

Hi John

Have you considered trying to model the antenna with EZNEC?
Antenna modeling scared me because I'm not bright. But EZNEC is quite
understandable and easy to use.

Jerry

3/16" is approximately 5 AWG. The ITT handbook gives the resistance
of copper-clad steel (a good enough approximation to zinc plated
steel) as about 1 ohm/1000'.

Compared to the resistance of a ground rod to Earth "connection" I
think that a few feet of steel wire resistance is in the noise.

I'd watch out for a zinc to copper connection tho.

John, phasing two electrically different driven, shunt fed towers is
not a task for the beginner... It is done by technically experienced
hams (and there are a number on here who can do it in their sleep) and
by broadcast professionals...
However, simply adding a tower 1/8 wave away, loading it to tune~3%
below the operating frequency and having it act as a parasitic
reflector is really quite simple... This is what I recommend you and
your buddy consider... Top hat load the tower and use the inductor
between the top of the tower and the hat as the final adjustment to the
tuning... Use a field strength meter to get the tuning correct...

There is a hotmail address for N1LO at
the very end of the link you posted. You
might try that.

I've emailed him on our local club
reflector suggesting that he post a
response to you on the newsgroup or that
he send me his current email address,
which I'll pass on to you, Ed.

Chuck

Do you have codes or standards that provide guidance, or requirements?

The standard applicable here in Australia suggests that it is likely
that earthing conductors need to be 35mm^2 copper or better (~ 2AWG).

The conductor used for lightning protection should be sufficient to
carry the anticipated current without deterioration and without risk
of fire.

People often design for a scenario like 20kA for 0.1s.

I don't know how 3/16EHS performs in that scenario, but I venture that
it probably has csa of about 10mm^2, conductivity of a tenth of
copper, higher inductance than copper (which affects the voltage
rise), higher specific heat and higher melting point.

Perhaps it is safer to use copper of adequate size.

Hi John,

Make sure to connect this in dependant ground to the service ground or
you will have created an yet undiscovered new problem.

I say this because of the clue offered in your statement above about
problems becoming WORSE (you probably didn't have that ground tied to
the service ground then too, did you?).

Source record: 49996

I have an M C Jones MicroMatch (Microwave Devices) and the pot in
the indicator unit (Model 262 w/ Model 261 Coupler Unit) was replaced
with a 500 ohm potentiometer. What is the correct value to allow the
scale to match the pointer, and is it straight or tampered? Would
like to have a copy of the schematic, if anyone can e-mail it to me.

Perhaps I didn't explain it correctly: What he wants to do is set up 1/4 wave in front of his shunt fed tower that is tuned to resonate say at 3.8MHz, another 1/4 wave vertical on a line toward Europe and feed it with a 90 degree phasing line. This is not rocket science for two equal size verticals.

The shunt fed tower is slightly over 100 degrees long physically and the second vertical is about 45 degrees long physically, inductively loaded to 90 degrees long.

Will these two unequal in size, but resonated to the same frequency, verticals behave the same as if they were both the same physical size ?

Short answer, no...
Long answer, yes...

And I cannot do a long answer justice here on a forum such as this...
Perhaps W7EL or W2DU will jump in here and rescue me...
The major issue you face is that the towers are shunt loaded which creates phase differences between the two right from the git-go, even when both are resonated... The fact that the feed points of the two towers are initially out of phase needs to be tuned out in setting up the 90 degree total phase difference...

Certainly it can be done... You will need to measure the input impedence and reactance for each tower as built...It will take a pick-up coil on each tower fed to an oscilloscope so that you can see the phase difference as you adjust the phasing network / phasing lines to reach the desired 90 degrees phase lag on the leading element...
Read W7EL's contribution to the ARRL Antenna Handbook on the subject of properly phasing lines / antennas... This will give you enough information to decide if you want to proceed...

I long ago decided life is too short for designing all driven arrays when I can build, install, and tune, parasitic arrays in less time than it takes me to work the equations for designing the needed phasing networks for a driven array...

Source record: 50000

I may try this approach, my tower is only 50' or so but It has guys on it,
The guy that goes out to my back yard is about 75' or so but is also
connected to the chain link fence that winds all thru the block that I live
on. (not sure what effect the fence will have if any)
Just a note: the guys do little more than keep the tower from swaying (rhon
25) when I am working on antennas etc.
I have radials everywhere and ground rods and there tied into the chain
link fence (I lost count of how many)
After I get it up, I can connect my antenna analyzer and see what kind of
readings I get.
When I make the feed point connection I can make it in a way that I could
remove the shield from the tower and change it into a normal dipole. I am
not sure where I could run that end but maybe I can sweet talk a neibor..

Am I NuTz?

I love playing with antennas...

Nope! I went over and looked at it from one foot away. One single CB whip
wound into about a 3-4" coil about halfway up. Looked pretty good, too. I
just don't know how he did it; never seen that done before.

>>>ground made RF feedback problems worse on some bands.

Hi John,

This is classic ground-loop conditions. One ground may have an
elevated potential over another ground (hard to believe, but it is the
practical reality). Current flows as a consequence. This is Common
Mode current (from a Common Mode potential).

You should in the short space of those three sentences be able to
observe several terms that are bandied about, but rarely understood.
This is because they follow on mysterious problems that defy
shielding, "grounding," and almost any other ad-hoc attempt that
inevitably fails as a solution.

One classic solution for providing ground to a tower is "I let the
coax shield do that!" Rarely does the operator consider that there
could be a huge potential difference between that remote point's
ground, and that at the house. The hidden killer here is when the
operator disconnects that coax (for whatever reason) and in that act
is holding the shield of the cable and some ground. He completes the
circuit, and like a fuse, may blow out.

More often I've heard:
"Look at the sparks I'm drawing!"
as the coax plug's shell is brushed up against the socket mounting
screws. My buddy pointed this out as the current burnt out most of
his ground traces inside his rig. It only cost a couple hundred and 3
weeks down time to provide remote grounding through the coax.

Source record: 50005

It's easy to see who's read Chapter 8 of the ARRL Antenna Book and who hasn't! Denny has the right idea.

What you need to do in order to get a decent front/back ratio from the two elements is to create equal amplitude and correctly phased fields from them. If one is shorter than the other, it needs to get more current to produce the same field as the longer one. The current at the feedpoint of a shunt fed tower isn't equal in either magnitude or phase to the current in the tower itself. So adjusting the feedpoint currents for some relative magnitude and phase won't get you the right tower currents unless you've accounted for the transformation.

It's much easier to get 2 - 3 dB gain than to get good f/b ratio -- you can goof up the current magnitude and phasing pretty badly and still get noticeable gain in about the right direction. (In a way it's too bad this is true, because a lot of people see some gain and assume it means that they've got the phasing they planned, when in reality they're way off. Then they extend this misinformation to other arrays and can't figure out why they don't work.) But with the setup you've described, it would be easy to be far enough off that you wouldn't get the gain, either, at least not in the expected direction.

It can be done, but as Denny says, it's much more complicated than just using a 90 degree "phasing line" as another poster suggested. That approach generally doesn't work for even the simplest of cases (see the Antenna Book for the reasons), and it certainly won't work here. What I would do is model the elements without the shunt feed system and adjust the base currents in the model (by putting current sources at the bases) to get the desired pattern. Then I'd make an adjustable feed system like the L network feed described in the Antenna Book or one of the other systems described in _Low-Band DXing_. Then I'd arrange some sort of current probes at the tower bases and adjust the currents to match the model currents. A final adjustment could be made by putting a signal source or detector to the rear of the array and adjusting for the best null. If you do everything just right, you'll get right at 3 dB gain over a single element and a very good null directly to the rear.

A parasitic array is an option, but again I'd model it. You have the same problem of getting the right element currents, but now the only adjustment you can make is the parasitic tower's resonant frequency. You might have trouble getting enough current in the short tower to do you much good. A second problem with the parasitic array approach is that any ground loss will eat you alive. Even what you consider to be a good ground system might not be adequate, especially for the short element. Be sure to include a realistic amount of ground system loss in any model

you make.

Alternatively, you can just connect the towers together through some
sort of arbitrary feed system (or you can carefully cut a "phasing line"
-- you have the same probability of success with either method) and have
lots of fun seeing in which directions it seems to work well and which
it doesn't.

To reiterate what has been said by others...
There are two issues here for your elevated ham shack... RF ground and AC/DC ground... Not the same critters and in your case one will not do both jobs...

First, for life and limb you need an AC/DC connection to the service panel, i.e. local electrical ground... Length of this does not matter... Second you need an earth ground as close to the rig as you can get... As I read this you have dropped wire out the window to a ground stake... Excellent, now get busy and continue on with that ground wire also along the edge of the house to the electrical service panel ground...

Now for the really important stuff, i.e. working DX, you need an RF ground... In your case I suggest that you use a quarter wave length insulated wire for each band you operate, attached to the common ground behind the rig... Hang or fan them out the window, run them through the ceiling to the attic, run them around the walls of the room, run them down the hall behind the baseboard, just whatever you can do to spread them out as long as possible .... Grounding a quarter wave radial at the far end is not a good idea... Tape the end so no one can touch the bare wire and leave it... That should cool off your RF problems...

To iterate what I have reported earlier. The problem was SOLVED,
for the bands I operate on, when I :
1) Ran #12 wire through the 2nd-story window sill and down to a 10 feet long copper clad ground rod. The length of the wire run is about 15 feet. (Let me worry about satisfying the "code" requirement of bonding this ground rod to the rod at the power service entrance.)

2) Installed an Amidon FT-240-77 ferrite toroid as a common-mode choke (11 turns) in the Orion's DC power supply cable and located about 18" from the Orion. http://tinyurl.com/qnzs3 The cable run between the power supply and the Orion is somewhat lengthy because the Orion is connected to an MFJ-1129 multi-outlet strip.

I thank you for your support.

The outside diameter of the cable, like .195, .240, .260, .405,... and the
gage of the center conductor, like #10, 14, 16, 18, stranded or solid.

1895. Mag mount capacitive coupling

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-03 18:26:09 UTC
From: Chris W <1qazse4@cox.net>
Message-ID: <8RL2h.35632$Jt3.34738@newsfe16.lga>
Source record: 50019
Cross-posted to: alt.ham-radio.hf,rec.radio.amateur.antenna

I have a 5" diameter 3/8-24 mag mount and was wondering if a mag mount like that would have enough capacitance to adequately couple to the metal surface it was on. Also is there a good rule of thumb on how much capacitance you need to have a good ground on a mag mount at a given frequency? I don't plan on having an HF antenna on this mag mount while driving. I also don't plan on using it on anything below about 20 or 30 meters.

As a side note I heard someone say that the mag mount has to be on steel for the capacitive coupling to work. I find that hard to believe. Obviously the magnet won't hold to aluminum or copper gut setting the antenna on any metal surface will provide the capacitive coupling, won't it?

Sorry, I thought you were talking about the original question. The base 9913
is #10 solid. 9913 Flex is stranded.

> conductor gauges?

Actually, the difference I was writing about in the original posting has to do not with whether the center conductor is solid or stranded, but rather with the form the dielectric takes. It's a polyethylene tube with fairly thin wall that supports the outer conductor, and inside that, a "thread" of polyethylene with a diameter half the difference between the inner conductor diameter and the ID of the polyethylene tube, which is formed in a spiral to support the inner conductor coaxially with the outer conductor. The result is that much of the dielectric space is air (or water, if you install it incorrectly...or get a lot of condensation in it). It's a very obvious differentiator from the usual solid or foam dielectrics. It's also low enough effective relative dielectric constant that the inner conductor is particularly large, for 50 ohm line of that OD.

Cheers,
Tom

That sounds like RG-62 (93 ohm).
Video terminal cable -- 3270 and that ilk.

But, since none of the mind readers in this ng have yet to post the
dimensions, it's only a data point so far.

Thanks K8DO and W7EL you fellows have answered my questions and made me realize that the one word that I was missing in all of this was "current". Strange how one word can turn on the light bulb. I need to get an updated Antenna Book, my old dog eared one is vintage 1965. Also EZNEC wouldn't hurt either. I'll try the demo first even though it means having to use Windows (I'm a Linux user). Thanks again.

Hi Chris,

This is distinctly suspicious, nearly as much as the claim that
mag-mounts provide a necessary capacitance. The cable's proximity to
sheet metal leading to the mag mount easily offers MORE capacitance
than nearly any single, isolated mount.

Both claims rely on the mystery of magic (as certainly no one has ever
explained HOW they work in distinct contrast to simple cable
proximity).

The "lot" comprises about 5% of the total market at the outside. Are you willing to pay 20 times as much for EZNEC as Windows users?

> That being said, is anyone running EZNEC under WINE?

At last report, EZNEC won't run under Wine. Wine malfunctions a couple of places when attempting to run EZNEC, although I think I could probably work around them. (Of course, there's always the danger that an update or upgrade would break the program again, since there's no way I know of to find out which Windows functions Wine emulates correctly and which it doesn't.) I won't, however, make any attempt to work around the Wine problems until Wine is able to open the manual, which it is wasn't able to do at the last report I got. The manual was created with RoboHelp, a popular help authoring tool, and there isn't any way for me to work around Wine's inability to read it. If and when anyone reports that Wine has advanced to where it's able to open the manual (EZW4.hlp), I'll look again at the possibility of finding workarounds to Wine's other problems with EZNEC.

EZNEC works fine under at least one Mac emulator, SoftWindows.

I would gladly pay double without a blink, and I doubt that it would be
that much work, in the long run, to make a Linux version. Your SW and
your call obviously, but you are making a very wrong assumption that
porting a version that runs under a different OS takes nearly the same
development effort.

I would gladly assist in making it work. I have no idea what language
it is written in, but as long as it is not in something MS specific it
shouldn't be that hard to port.

At 2m and above, a surface equal to or greater than a TV tray works consistently well for me. Mounting, attaching or otherwise arranging such a surface becomes a mechanical issue, only.

For 10 m HF, if you have a small magnetic surface (iron, mild steel, etc) and you cement it tightly to a larger conductive surface (aluminum, copper, stainless) that may be all you need. By "cement," I mean attaching with some of that goop that comes out of a tube like toothpaste and then hardens.

This works like a champ at CB freqs, for sure, so it will likely work at 10 m. My buddy asked about a CB magmount for his motor home. I had him cement a steel plate in the middle of the aluminum roof and he had excellent performance.

The guy was a ham in high school and let his license lapse while he was in the military. I urged him for years to retest but he never did. He's gone now.

Sigh. I get this a lot.

The main program, 70,000 lines of code at last count, is in Visual Basic 6 and incorporates many direct calls to the Windows API for speed and increased functionality. The calculating engines (a few tens of thousands of lines of code) and some main program routines are in Fortran, and make use of commercial math libraries for fast calculation of some complex functions. The Fortran routines also make a limited number of Windows API calls.

The port of a functioning EZNEC program from DOS to Windows, back when EZNEC was somewhat smaller, took me about two years of full time work. After some short experiments with VB.NET, it looks like a port to that (Windows) language probably would take something like six months, plus an unknown amount of time to find and solve the huge number of subtle bugs caused by the port. But not only would the user not gain anything, there would actually be a negative impact, so I don't plan on doing it. Converting to a C Windows program would probably be a one or two year project. That might make it easier, although by no means simple, to port to Linux, but would be of no benefit to Windows users so the Linux market would have to pay for the effort. Sorry, you'd need to pay a lot more than twice the current price. (I happily run my EZNEC business for a fraction of what I can make doing consulting, but I don't work for nothing. Contrary to what seems like a common perception, I'm not retired but earn my living from EZNEC and consulting.)

I encourage anyone who thinks it's a simple matter to develop a Linux program of the level of EZNEC to have at it. It's an untapped market.

I'd like to add a question.

Why, instead of trying to get the Windows program developers to spend countless hours developing programs for the minuscule Linux market, don't the Linux users spend a little time getting Wine to work properly? If it seems to simple to port programs to Linux, why is it so hard to get open-source Wine to work?

Hi Tom

I recognize that you are discussing *programming* and that you know alot
more about computers than I do. But, I am so impressed with the capability
of the EZNEC as a tool for learning that I wanted to remind other readers
that a "good enough for running EZNEC" computer can be purchased for no
more than $50.00.

Hello All,

I bought a VHF mobile scanner antenna from these folks back in the
1970's or 1980's and was wondering if they were still in business.

Does any know of their whereabouts or, perhaps a website.

I'm trying to find the specs for the antenna.

Many thanks for taking the time to respond! :-)

And it points out that when people look into buying a computer or operating system, they should pick what tools (software) they want to run, and build their system around that. Most people buy a computer or install an OS, then want vendors to write for that.

I'm coming in a little late on this discussion, has EZNEC been tried on the Intel based Mac's running windoze?

Very good point indeed. Additionally, for those who do not wish to
have two computers on the desk there's always the option of having a
dual boot system. That's what I use here and have the best of both
worlds.

I have a computer with Linux installed. Perhaps I is a dummy, but even just installing programs, or searching for drivers is a nuisance. I'm always told how such and such flavor of Linux doesn't have that problem, but I'm on flavor number three, and still waiting for I don't have enough experience in it to make a firm judgement, but I think we are supposed to be happy if the operating system and hardware just works, let alone the software.

Awaiting my one-way trip to Linux hell for what I just wrote....

Hi Roy,

Non portable design issues inherent in self-serving Microsoft
products. [This is not an aspersion on EZNEC or similar products or
vendors, it is simply the fact of life when you are tightly wed to the
Microsoft platform.]

M$ is a marketing company, not a development company. Ask any vendor
facing Vista, especially those whose Security niche market (Symantec,
McAfee) is being blind-sided.

M$ is claiming to have gotten it (Security) right this time. Of
course, this claim is indistinct from any similar claim made in any
week's press release for the past two decades. Their LATEST release
of (proprietary) Internet Explorer came complete with a feature that
allowed hackers to take over your machine. This news, too, is
indistinct from any industry weekly press release for those same
decades.

The sub-text response to your question is, "Why would Wine try to
emulate everything given this level of jeopardy?" At some point (and
as you basically offered Tom) you simply start over and do it right.
The alternative is that dedicated soul who finds their mission in
bringing down the evil empire by burrowing into every line of reverse
engineered code.

M$ and other industries think they dominate through sheer force of
numbers. One Jon Lech Johansen proved that both Hollywood and Apple
cannot summon up enough engineering head count to withstand being
whipped by a single individual. Of course, both Hollywood and Apple
relied on Marketing to do the Security issues, not their legions of
design engineers (many of whom are equal or better than Johansen).

Wow.....when I posted back about phasing verticals and my questions were answered by Roy, I mentioned sort of half hardily that I would have to use Windows to run EZNEC. Looks like my post took on a life of it's own. I'm what you can call a "Joe sixpack" when it comes to a computer and I have found the latest distributions of Fedora, SUSE, or Ubuntu to install and find all my drivers and hardware without a hitch. The finished install will give you a system that will be able to surf the Internet, do E-mail, chat with your buddy's on an IM if that is your bag. comes with a fine office suite, photo imaging software etc.

The only drawback is propriety stuff such as multimedia programs etc. That stuff is available but it has to be installed later and that's where the "one-way trip to Linux Hell" begins for the first timer. although now even that is becoming point and click with the latest distros out there. I boot 4 different flavors plus Windows on one computer.

For those that want to give Linux a try for the first time my advice is to install it on a separate computer just for Linux. It behaves nice on a Windows box, but if you are not somewhat familiar with partitioning and writing to the MBR for a dual boot and getting it back to a Windows default if you mess up, keep it on another machine.

There is plenty of help on the Web, just do a Google search for a guide for which ever distro you have. The best part?.....with a broadband connection you can download and install Linux in half a day or less for FREE. check out http://distrowatch.com/ and pick your poison.

This is not quite on topic for antennas, so excuse my rant on Linux. For me it's great, for you, maybe not. It's not Windows and I hope it never is. It's a Unix type system like a Mac, with a hell of a lot less worry about viruses and spyware.

Rolling my own here Richard. Started out with Turbolinux, then another I'm afraid to say I forget the distro, and now have Fedora. I'm told SuSE is wonderful - and I was told that of the other flavors too. So I'm a little skeptical by now.

Problems have been with installing software, hardware incompatibility, Internet connectivity - nothing like having to spend time looking for drivers - going to bbs's - eventually I found out that my wireless card simply wasn't supported AT ALL! That was special.

I'm still hoping to find a flavor of Linux that won't give me indigestion.

One of my biggest frustrations with Linux is that I use a Mac for most of my work, so I know just how nice a Unix based system can be. Install the software and use it. Period. Plug in the peripheral. Bang, there.

Only time I have to drop to command line is occasional server maintenance, and even that is less and less often with the new Xserve tools. My biggest complaint is permissions problems that crop up occasionally. They are easy to solve, but a nuisance.

Hi Mike,

I've traveled the same path over the years. About a year ago I wrote
a step-by-step guide for installing Fedora into a cold, bare machine.
I also wrote a step-by-step guide for building servers (Apache/MySQL
and the rest); and then followed up with a step-by-step guide for
specialized application servers, Wikis and CMS packages. Of late I
have also ventured into RubyOnRails with another a step-by-step guide.

> Problems have been with installing software, hardware incompatibility,
>Internet connectivity - nothing like having to spend time looking for
>drivers - going to bbs's - eventually I found out that my wireless card

Hint: Support for "special" costs. Yeah, cold comfort - sorry.

> I'm still hoping to find a flavor of Linux that won't give me indigestion.

Try Rolaids, or pay for support by buying into a vendor with a good
reputation (you already indicate you know several).

Almost every connectivity and configuration issue I researched was
answered through a google newsgroup search, and then going to the
links offered in their discussion. I presume you've already mined
that approach. I have periods of this idle time, like now, that allow
me to research these issues interspersed with intense demand for my
attention. I also make it a habit to keep a journal in a nearly
publish quality format. Memory (wet ram) is for the good things,
ephemeral details like Linux configuration is for filing.

I have nothing to offer for your specific driver need, sorry. However,
for others, feel free to contact me for these guides.

Sorry, I didn't know it was in VB. I can understand how that makes it nearly impossible as I have worked where we had to do what you did going from DOS basic to Windows VB. I was hoping it was in something like C.

I know what it's like to have an outsider ask you to port something that's large and then be surprised when told how long it would take. Ericsson was a bit miffed at me when told how long to port my US (Honeywell) version of the MD110 PBX database regenerator to an international version, and mine was all text based C.

Thanks for the response Roy.

1932. Request for information on phase matching and set / batch matching

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-04 22:25:16 UTC
From: David <nospam@nospam>
Message-ID: <O8GdnTyz64XWjtDYRVnyuw@bt.com>
Source record: 50056

Can anyone post any informationon or web addresses on phase matching and batch / set matching of coax cables? I am interested in principles and procedures to phase match coax cables. Phase matching involves cutting coax cables to the same electrical length. The phase matched cables can then be analysed and put into batches or sets i.e. cables with similar characteristics and frequency response are put into a set. What would be analysed to form a set?

This practice is used on coax cables that feed antennas for satellite systems. For example, if several antennas receive GPS signals, to triangulate position, the GPS signals must all arrive at a particular point at exactly the same time.

It also appears that going for the best quality low loss cable can actually be worse, because using lower quality coax cable with some loss can dampen the reflections from in-line connectors.

Stages are 1) phase matching 2) batch matching 3) assemble cables chosen by batch matching process onto RF system and perform vector generation. A vector gen file is created which is a calibration snapshot of the system i.e. records the RF performance in the form of a signature or footprint.

Measuring instrument is a Network Analyser HP8753.

I have seen large coil springs being made. One long steel rod is allowed to roll down an incline from a hopper of rods. Each end of the rod is grasped with an electrode and a large amount of current is sent through the rod. In about 10 or 15 seconds, the rod becomes red hot. The soft rod is then wound around a cylinder to form a coil. I do not remember what heat treating was applied.

One could use such a procedure with the SS whip.

If all the seats are taken at a club meeting and a 20wpm code tested Extra
is standing, a no-code ham should give their seat to the Extra and sit
on the floor. After saluting of course.

SC

Not only should the No-Coder give up his seat to a superior, he should also
wipe it clean with disinfectant.

That circuit is pretty common I would check the ARRL books for a schematic
and use what ever is there. I have a homebrew one that uses 5k.

Good Morning Fellow Antenna "wizards"!
I always seem to get these "brain-storms" late at night. I have a 706 mobile with a small auto-tuner. I use a hustler 80m coil with a cap hat. I am mainly interested in getting 80m as best as possible....right now. Now,I know that hams stuck in condo's or apartments with limited space can take "two hamsticks" OR even two "Hustler" set ups and get a special bracket an mount the whole thing like a "DIPOLE"!!! Some even use these "dipole set-ups" as drive elements on a YAGI!
Now "WHY" wouldn't that type of set up WORK on the rear of a car ??? Instead of using the car as the":other half" of the antenna.....you would have an "equal,balanced-shortened dipole" on a special mount. Naturally,you would have to fix it so that you could feed it in the center of the antenna. Would this "thing" work as a mobile antenna??

73's, Paladin

p.s.-I probabally should fire up the ENZEC to see what "it" would say about it. I'm on a laptop now. I'd have to go downstairs to do the ENZEC thing.

Sure it would work. How well depends upon the car. If you do model it,
you would need to include the car as part of the antenna.

Obviously a car made from plastic (there were two models, one made in France,
one made in Israel, both in the 1970's) or fiberglass would be a better
choice.

Geoff.

1948. receiving HF antenna for urban conditions

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-05 12:49:06 UTC
From: Toni <devegades@gmail.com>
Message-ID: <1162730946.761930.152060@h54g2000cwb.googlegroups.com>
Source record: 50072

Hi,

I'm moving to a new urban QTH in and trying to figure out the best HF antenna installation.

I'd like to have distinct HF antennas for RX and TX: a vertical for TX where only performance matters and "something" for RX where the main problem is going to be tons and tons of local QRM.

I don't know what could be this "something". I'd probably like some kind of loop or small dipole or whatever I can point and can be isolated as much as possible from local noise received in the supporting mast and feed line themselves. It should be something physically small because of neighbors, etc.

I'd prefer to build them myself but would buy them if something seemed interesting enough.

Feedline is going to be about 100 ft long

What would be your suggestion?

Thanks

the original 9913 has a 9.5ga solid copper center conductor, the center
conductor has a spiral wrapped standoff insulator, a thin solid dielectric
layer then foil and braid shield. the od is .405" so it can't be easily
distinguished from regular rg8 without looking inside. though if it is the
original good stuff i would expect it to be well marked on the outside since
not just everyone made it. the problem is that there have been many
variations over the years on 9913, including stranded center conductors and
some variations in dielectrics.

it may 'work' but how are you going to mount it? it would be too wide to
mount cross wise, and if you mounted it on the rear bumper then half the
antenna would stick the guy behind you in the eye. also a low dipole like
that is likely to be just as lossy as the vertical fed against the car since
it would still couple very tightly to the car and road.

Ground-mounted loaded verticals can work very well.
Very low loaded dipoles don't.

>use these "dipole set-ups" as drive elements on a YAGI!
>Now "WHY" wouldn't that type of set up WORK on the rear of a car ???....

I DID just that except I mounted the dipole pointed fore-and-aft atop
a two-foot high mast fastened to the front "canoe carrier" (or ladder
carrier) atop the "topper" on my F-150 pickup truck.

As an NVIS antenna, it worked like a charm -- I live in Kansas and
that antenna "covered" Kansas and the 4-5 surrounding states on 80
and (by changing the hamsticks) on 40!

I originally worried that the forward-pointing antenna tip might
suffer from severe whiplash, but, at 60+ mph, it merely described
maybe-foot-wide circles in the airstream.

Unfortunately, while it was just low enough to clear my garage door,
one day the forward tip "speared" the garage-door pulldown loop and
ripped the antenna, mast, and about half of the canoe carrier off
the truck before I could stop!

But it was a GOOD mobile antenna, and I may erect it again!

My thanks to the four of you who responded to my query looking for 3/8"-24 coupler nuts for an antenna project. Some of your responses were unavailable to me, and some weren't. I did manage to find what I was looking for as a result of some. Thank you all for the help.

I'm using an 8 foot mobile hamstick horizontal off my back balcony in a
2nd floor apartment. The noise is a problem, but I can mitigate it quite
a bit with my MFJ-1026 which allows me to have a second receive antenna
and beat it against the main transceiver antenna for the purpose of
phasing out the noise.

That's an interesting possibility but probably not useful for multiband
operation considering the antennas will be at the roof which is 4
stories (is that the right word?) above my apartment. But makes me
think of some kind of close phased small monopoles with a separate
preamplifier for each and the phasing network down at the apartment.
Will try to do some modeling and see if it is doable. Reminds me of the
Flag/Pennant antenna. Probably too big.

Thanks,

Toni,
If you want separate antennas, (aerials), and IF you have the room,
(hence the 100 ft feed line), and IF you want to build the thing your
self. . . Might I suggest for your receiver, a Caged Dipole? In the
more modern world, it is referred to as a Fat Conductor Antenna. I
asked a little bit about them here, and found out a lot more than I
thought I would have, being that these are just about extinct. They
offer many possibilities for what I believe you are looking for in a
receive end application.

1974. Fix up your NEC2! (Bug fix)

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-06 11:42:03 UTC
From: neok <n5b4az@yahoo.com>
Message-ID: <1162813323.449354.107670@b28g2000cwb.googlegroups.com>
Source record: 49948

Hi,

I am taking the liberty of posting here a copy of an email I received from Gerry Burke, in response to a NEC2 bug report which I mentioned here a few days ago. This email details the changes needed in the NEC2 FORTRAN code but it is also very informative on the subject of wires connected to patches and the use of the EK (extended thin-wire kernel) card.

Tim Molteno has already fixed his C++ port of the NEC2 (http://alioth.debian.org/projects/necpp/) and also mentioned he would fix a copy of nec2c, my translation to C of NEC2, which I understand will be available in the same project site. At the moment I am very short of time, and I expect to fix the "nec2c" and "xnec2c" (X/GUI version) in my website after I complete the work I am doing to make xnec2c multi-threading (it is now in the alpha bug-fixing stage).

73's Neoklis 5B4AZ http://5b4az.chronos.org.uk/

G. Burkes bug-fix for the NEC2:

You are right, there is a bug in NEC-2 when the extended thin-wire kernel is used with wires connected to patches. This has escaped detection for over 20 years. I did not catch it yesterday, because I had MAXSEG=10000, and ICON1 and ICON2 are dimensioned to 2*MAXSEG, so 10000 did not exceed the bound.

The problem can be fixed as shown below. In addition to subroutine CMWW, where you encountered the problem, the same changes need to be made in subroutines NEFLD and QDSRC. With this change the extended kernel is not used at a wire end connected to a patch surface, but would be used on the rest of the wire if it is straight .

The extended thin-wire kernel is only used on thick, straight wires, so is not very useful. The code turns it off at junctions, bends and changes in radius. Also, the connection of a wire to a patch surface is not good in NEC-2 or 4. It works fairly well for something like a monopole on a surface, but not for a half loop connected to the surface. A wire grid surface provides a better connection for a wire antenna.

NEC-4 does not have the extended kernel, but instead puts the current on the wire surface with match points on the axis, and has an approximation for wire end caps that reduces the instability when the

segment length to radius ratio is small. So NEC-4 would not have
this problem.

Thanks for finding this bug.

Jerry Burke
LLNL

To fix the extended thin-wire kernel with patches in NEC-2:

No...Where's the evidence of Slow Code being a bozo...?!?!

(And I passed the 20WPM when I still had to send, too...)

Steve, K4YZ

1977. Stripped off coax velocity factor

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-06 12:49:07 UTC
From: PaoloC <ollollo@hotpop.com>
Message-ID: <454f2f0c$1_2@x-privat.org>
Source record: 49951

Hi,
I cannot come up with an answer.

Let's say I have a coax cable with 83% velocity factor. I want to use its inner conductor (that is solid copper single conductor) so I remove the outer sheath and the braid.

I am left with the inner conductor and what was the dielectric, now performing as an insulator around my wire.

What is the resulting velocity factor?
* 83%, as the original cable
* 100%, copper's
* something else?

I have experienced that wire dipoles and verticals built with insulated electric wire have a final length shorter than the theoretical value. I "suspected" the PVC coating to vary the velocity factor. Am I wrong?

Thank you in advance for your hints.

What you have left after the stripping process is just a wire with a thick insulating jacket... The fact that it was part of a coaxial cable before the stripping has no more bearing on the answer than the fact that the copper was previously greenish ore nodules buried in the ground and the jacket was made from nasty smelling crude oil...

So, forget all about 'coax', it has nothing to do with the question... If your new wire had a jacket of the usual thickness then the loss of velocity factor would be on the order of 3% compared to the usual 983/F or 300/F... Given that it is a thick jacket I would guess the VF to be down by 5%... So take what ever formula you are working with to determine antenna length and reduce that length by 5% for cutting your wire to resonance...

Something else. EZNEC will even model it for you.
The user can set the dielectric constant and
thickness of the dielectric in the "wires" menu.
For instance, 0.1" of polyethylene insulation
on #14 copper wire lowers the resonant frequency
of an 80m dipole by about 5%.

David first let me comment that using lossy coax to make the results look better is muddy thinking at best... Use the lowest loss feed line you can get, period!

Next, check the ARRL Antenna Handbook for a diagram of the equipment and layout for cutting coax to resonance at a given frequency... I have not worked at GPS frequency but the basics are the same at 435 mhz - just harder at the higher frequencies...
A signal generator for driving the coax... Put a 3dB pad on the output of the generator to stabilize the impedence it sees... At the load end of the coax is a resistive load for terminating the coax in its characteristic impedence... An oscilloscope pick up across the load for seeing amplitude and phase... I normally drive the coax at a frequency that makes that coax length an odd 1/4 wave at the test frequency... Then I trim the coax for the voltage minimum...
As far as phase batching the the individual coax pieces after they are cut to frequency I would pick one coax piece as the master..
I would put a splitter on the output of the generator and drive this master coax from one side of the splitter and also drive a test coax off the other side of the splitter... At the load ends of the of the coax pair I would use a dual channel oscilloscope. or vector meter, etc., to compare phase between the load on the end of the master coax and test coax, repectively......

Now, having said that let me comment that unless you are using hard coax, I suspect at GPS frequencies just routing two flexible coax cables around the innards of a piece of electronic gear will introduce enough internal mechanical distortion to cause phase variations at the load ends... I may be wrong but that is my suspicion..

Actually, any small wire whip just base fed out on the roof would do for
the noise antenna. It doesn't have to be efficient, since the unit has a
pretty high gain preamp in it for the noise antenna.

Hi Denny, and student,

This pad should exhibit a 50 Ohm load to the source, and a 50 Ohm load
to the line. This is usually a T-Pad.

>At the load end
>of the coax is a resistive load for terminating the coax in its
>characteristic impedence...

This is good advice, which, unfortunately is thwarted by the advice
for:
>An oscilloscope pick up across the load for
>seeing amplitude and phase...
Wrong. At frequencies above 50MHz (or 200MHz for the best of
equipment), you should always use a 50 Ohm load to the input of the
O'scope - NOT a probe, or link.

>I normally drive the coax at a frequency
>that makes that coax length an odd 1/4 wave at the test frequency...

Odd Eighth wave is much better as transformations will be far easier
to measure - and easier is indicative of available accuracy. Quarter
and Half waves do offer convenience when you terminate in opens and
shorts, but with other loads (other than the characteristic Z of the
line), Eighth wave is preferable.

As for Half or Quarter Wave choices, short the far end. Open
terminations are problematic. Measuring a open/short termination
transformed as a short is preferred. Hence, the best configuration is
a shorted Half Wave line.

>Then I trim the coax for the voltage minimum...
>As far as phase batching the the individual coax pieces after they are

>and test coax, repectively......

This is taxing the resources of equipment at 1GHz. The method is informative, but it does not reveal the accumulation of error (and our student hasn't actually expressed how accurate these matches need to be).

>Now, having said that let me comment that unless you are using hard

I suppose you left out some (rather important) stages...

The first one I'd put down is: select the cable. The physical design of the cable is important. Some cable changes appreciably when it flexes, and some changes appreciably as temperature changes. (If it changes significantly when the humidity changes, you've REALLY picked the wrong cable...) Cable with properly installed, high quality connectors should not show significant reflections from the connectors, and even if it does, if all the cables are assembled the same, the effect should be the same on all of them.

Cable of a given physical size and general construction should have close to the same loss. If you want MORE loss, pick SMALLER cable, and especially pick cable with smaller inner conductor. Stranded conductors also help increase the loss. But if you have two similarly designed cables, and one shows appreciably more loss at GHz frequencies, definitely avoid it. The key reason is that whatever is causing the loss is likely the result of a poorly controlled manufacturing process, and that's something you do NOT want to put up with in precision matched cable assemblies.

What exactly do you want to match? Phase as a function of frequency, over some particular range of frequencies? Attenuation, also over the range of frequencies? Something else? Some combination of characteristics? I would expect it would depend on the application. If you assume that the cable assemblies are linear, and that they are adequately represented for your application by a two-port model, then measure them with your vector network analyzer. Especially since you are going for MATCHING and apparently don't need absolute accuracy, let the analyzer (powered on) and the cables stabilize in the stable environment where you'll measure them, do a reasonable job calibrating the analyzer, measure each of the cables (S11, S21, S12, S22, over your range of frequencies), check the calibration of the VNA, remeasure the cables (or at least spot-check them) to be sure you get the same results the second time. If all is good, arrange the cables using whatever measure of match you need for your application. If you need matching over a range of temperatures, or where one cable is at a different temperature than the others, measure under those conditions. Note that if there are measurement errors, if your technique is consistent, those errors should be very nearly the same for each cable that measures the same: matching will be better than absolute accuracy.

Note that if you are measuring completed assemblies over a range of frequencies, you likely won't have the option of picking an "odd number of 1/8 wavelengths," or any other particular number of degrees, for your measurement. Let's say your cables are 10 nanoseconds long (a couple meters). If you want to check the match from 1.6GHz to 1.7GHz, a rather narrow range, the cable length varies by 360 degrees. But that doesn't matter: for matching, it's the repeatability of the measurement that does matter. If you get to caring about absolute accuracy, check the accuracy specs of your instrument, and read ap notes...

Have you checked for HP and/or Agilent and/or Rohde & Schwarz and/or Anritsu (and perhaps some others) ap notes? I know for sure that there are a lot of them from Agilent (which may have originally been written at HP, before Agilent split off). Since you are using an HP8753, give you local Agilent sales rep a call if you can't find the ap notes on the web, and ask her/him for applications information.

Cheers,
Tom

1995. Re: Stripped off coax velocity factor

The term "velocity factor" usually applies to a transmission line which has two conductors. (I'll exclude the "G line" and variations from this discussion.) Velocity factor describes the speed of propagation of the differential field between the two conductors (including any fringing), and is equal to 1/sqrt(keff) where keff is the effective dielectric constant of the material in which the field is propagating. If some of the field is in air and some in another dielectric, the effective dielectric constant will be some value lower than that of the other dielectric.

In a coaxial cable, the entire field is confined between the conductors -- inner conductor and shield -- so the effective dielectric constant is that of the insulating material. In the case of your coax, the insulating material is a combination of air and plastic, with an overall effective dielectric constant of 1/(0.83)^2 ~ 1.45. When the shield is in place, this is the effective dielectric constant for the field, and it determines the velocity factor.

When you remove the shield and excite a transmission-line mode of propagation, the wire is one conductor of the line. The other is effectively the Earth, another half of a dipole antenna, and/or other nearby conductors. It should be apparent that the vast majority of the field between the conductors is now air. Consequently, the effective dielectric constant for the field is very nearly 1 -- that of air -- and the velocity of propagation of the transmission line mode is very nearly one. The actual value depends on the thickness and dielectric constant of of the wire and dielectric and the spacing to other other conductors. In practice, the in effective length between insulated and uninsulated wire in an antenna ends up being around 2 - 3% for typical insulating layers. EZNEC has the ability to include a thin insulating layer on a wire, so you can use it to find the difference in resonant frequency of, say, a dipole with and without the insulation and from that infer a "velocity factor" change caused by the insulation. The use of that term for propagation on a radiating wire is a bit outside the use generally accepted in the professional community. It seems to be a common use among amateurs, however. If you want to use that term in this context, a representative typical value would then be 97 - 98%.

What sort of mode should be used on a Network Analyser for phase matching? Should it be some sort of Time Domain Reflectometer mode?

Input impedance of network analyser is 50 ohms. Many cables are 75 ohms impedance. For tests on these, a 75 ohm to 50 ohm converter or adaptor is used. Adaptor name is something like 'min loss pad'.

My application is a system that checks the RF performance of a Unit Under Test (UUT). The test cables that mate with the UUT are longer than the UUT, so the aim is to get the cables to be exactly the same. This is reason for phase and batch matching - to avoid differential error.

Because a lot of cables are analysed, the analysis is performed by computer which connects to Network Analyser. What data sets e.g. S12 should be compared by the Network Analyser to batch match the cables?

Cables have different connectors on end, but still have to be batch matched. Have you any suggestions about this? Cables all have SMA connector at one end. At other end, the connector can be 1) SMA 2) 50 ohm N type 3) coax contact in circular connector.

Normally, phase matched cables are all made from same coax drum. Ensure coax comes in on one big drum, not lots of small drums that may have been made at different times using different processes (e.g. different operator or machine setting).

Cables are batch matched and assembled. If several years later, a cable breaks, how do I get a replacement batch matched cable to repair system? Although, I would have kept spare cables from original build, the cables on the system will have been subject to a different environment e.g. different stresses and humidity.

Another scenario. RF cable is built in slightly more humid environment, resulting in more moisture in dielectric. Vector gen run and passes. Cable dries out becoming much better. Vector gen then fails. It appears that a cable can become too good.

So--is this a homework assignment?

David wrote:
> What sort of mode should be used on a Network Analyser for phase matching?
> Should it be some sort of Time Domain Reflectometer mode?

Since the VNA operates "native" in the S-domain, I would recommend just doing S-parameter measurements. I believe you will find that all other measurements are derived from the measured S parameters. As I wrote before, if you believe that the cables are adequately represented by a linear two-port model, then the S-parametes tell you everything you need to know. (But a two-port model may not be adequate.) Caveat: be sure to measure them over a wide enough frequency range that you are sure that there is no phase ambiguity. VNAs typically do not distinguish among 0 degrees, -360 degrees, +360 degrees, +720 degrees. But the slope of phase versus frequency is pretty much a give-away clue.

OK, noted. If you are doing a lot of 75 ohm testing, you may perhaps want to get a 75 ohm VNA.
>

I'm not clear on what you're saying here. If you think that simply matching the pair of cables that go from your HP8753 VNA's Port 1 and Port 2 to the UUT will yield accurate test results on the UUT, you are sadly mistaken. To begin with, there is no need that the cables be matched in impedance, physical or electrical length, or loss. They may even have impedance irregularities, and things will still work. What will work _best_ is if they are low loss and stable. There definitly IS an Agilent/HP ap note about this sort of thing. What is important, if you want accurate absolute measurements on your UUT, is that you CALIBRATE the test system, including the VNA, the cables, and whatever else you have to connect up to the UUT. Modern VNAs, and in particular the HP/Agilent 8753, are designed to be calibrated at some plane in general remote from the VNA's ports, to automatically remove the effects of whatever cables you use to connect to your UUT.
>

> Because a lot of cables are analysed, the analysis is performed by computer

> compared by the Network Analyser to batch match the cables?

OK, back to matching cables: what you match is up to you. YOU decide
what's important. YOU may wish to put together a "cost function" that
accounts for how badly you want each parameter matched. What is
important in your particular application? You have four
two-dimensional parameters to deal with: S11, S12, S21, S22.
Presumably on a passive line, S11=S22 and S21=S12...
>
> Cables have different connectors on end, but still have to be batch matched.
> Have you any suggestions about this? Cables all have SMA connector at one
> end. At other end, the connector can be 1) SMA 2) 50 ohm N type 3) coax
> contact in circular connector.

And you are trying to match cables with different connectors? That is,
you're trying to match one cable with an SMA and an N, to another with
two SMAs? Good luck! How do you then define where each cable ends?
There are ways to do it, but it's going to depend on just what you are
trying to accomplish in the end.

If you're only trying to match cables of one type with others of the
same type, what's the problem? You can put in whatever adapters you
need, and measure the cables. For matching, what's important is that
they are the SAME, not that they are some absolute value.
>
> Normally, phase matched cables are all made from same coax drum. Ensure coax
> comes in on one big drum, not lots of small drums that may have been made at
> different times using different processes (e.g. different operator or
> machine setting).

And you have control over this? And you'll maintain control over
this when they cables end up being manufactured by a CM overseas? You
may well end up spending all your time just making sure they put the
connectors on the cable properly. Anyway, if it ends up not affecting
your final yield, does it really matter? Maybe you should just buy the
raw cable from a vendor that has taken to heart the idea that process
control is key. That vendor's cable may well be more consistent from
reel to reel than another's is within a single reel.
>

> breaks, how do I get a replacement batch matched cable to repair system?
> Although, I would have kept spare cables from original build, the cables on
> the system will have been subject to a different environment e.g. different
> stresses and humidity.

You want them matched? Buy a new set. If one broke, and they are all
subject to roughly the same conditions, the others are most likely near
(or beyond) the end of their service life. If there are stresses on
them that can change them, and if matching is important, why have you
not set up a calibration cycle on them? If you kept a spare or spares

of the set, why did you not cycle those through the active set on a regular basis, if you think that they will be affected by whatever environment the active set is subject to? If, for example, they are bundled, why not just include the spare(s) in the bundle, terminated in dummy connectors, so they are always ready to go? There are solutions for what you suggest. There are undoubtedly engineering (technical, cost, ...) tradeoffs among the different solutions. Evaluate them against the application and pick one. If you discover you picked the wrong one, learn from the mistake and do it differently the next time.

> Another scenario. RF cable is built in slightly more humid environment,
> resulting in more moisture in dielectric. Vector gen run and passes. Cable
> dries out becoming much better. Vector gen then fails. It appears that a
> cable can become too good.

If you're worried about that, why have you not set up a calibration in the "vector gen" that takes care of it? (The dielectrics and jackets on cables properly chosen for the application should not have a problem with humidity. Also, consider where most of the loss in coaxial cable is...)

Your questions sound a lot like they are spurred by a homework assignment; they are too broad it seems to be targetting a particular application. That's all OK, but at some point, you have to get down to the tradeoffs for a specific application, and make your choices based on that--on what you have control over, on what the specific needs are, on the costs ($, time, other resources, ...) associated with various solutions.

Cheers,
Tom

Hi Both,

This has all the hallmarks of a mutual suicide pact.

The right source for matched lines is from a vendor such as:
http://www.micro-coax.com/pages/products/ProductTypes/CableTypes/Semi-RigidCoaxialCable.asp
where a specific example has sub percent tolerances:
http://www.micro-coax.com/pages/products/ProductTypes/CableTypes/Semi-RigidCoaxial/Semi-RigidDetails.asp?ID=UT-390C

And the question remains:
"What is the degree of matching?"

The answer to this spans cables from Radio Shack, to the provider
offered above who specializes in precision.

The velocity is simply the speed of light if the wire is uninsulated (except, of course, for traveling wave antennas like a Beverage, where transmission line type analysis and "velocity factor" are appropriate). Analysis of antennas made from insulated wire is rare, and perhaps "velocity factor" is used in that case.

When using a transmission line analogy to explain antenna operation (more-or-less but not completely accurately), the model usually assumes speed of light propagation along the line, then a load at the end which effects the shortening of the resonant length.

Thanks for posting that Jim. Maybe now people will see dumbing down ham radio was a bad idea.

If you're really a code tested Extra, why do you want to dumb down ham
radio? You should help me push for better radio exams by supporting an
increase in speed of the code requirement. If we can get rid of the
no-codes and nickle hams, test everyone up to 13 and 20wpm, no one will
have to sit on the floor at club meetings anymore.

I like it, but there's only one problem. No-codes don't use toilet paper.

Somebody is going to have to Elmer them on how to wipe a butt and since
it's your idea....

I don't follow that logic. Looking back over the last six years in the
Republican administration I see mostly death, destruction and deficit.
Live, maybe, but live miserably.

I'd vote Republican if it made sense, but it just doesn't right now.

What about Republicans and ham radio?

I don't want to dumb down amateur radio, but you very much want to.
You see, amateur radio is supposed to be about advancement of the art,
```

and preparing and maintaining a civilian population with contemporary communications skills Mandating a mode that has fallen completely out of military and commercial use as obsolete is contrary to the concept of advancement of the art. It is as if blood letting was a required course for a medical degree.

Code is fine for those who like that mode. I use it at least once a month. However, it is no longer the mode that is best in weak signal conditions, or that uses the narrowest band width for effective communication. PSK31 runs circles around code. And guess what....many of the most fervent code guys I know cheat and use computers to print the received code on a screen, and a keyboard to allow the computer to generate their sending.

An amateur extra exam these days covers information a lot more current than that on the exam just a few decades ago. Perhaps instead of harping on code as some indicator of intelligence, you should direct your efforts to having all hams retested on license renewal, to make sure they continue to be current with the state of the art in amateur radio. Or do you believe that de Forest era vacuum tubes are more relevant to amateur radio in the 21st century than integrated circuits?

Uh, correct me if I'm wrong, but I thought a Republican -was- in office when people died in a collapsing skyscraper.

Boy, you really -are- giving that "slow" moniker a workout!

Uh, correct me if I'm wrong, but I thought a Republican -was- in office
when people died in a collapsing skyscraper.

Boy, you really -are- giving that "slow" moniker a workout!

..

Yes, indeedie! And a DEMOCRAT was in office when we were attacked more than
a dozen times around the world, including the FIRST World Trade Center
attack.

2025. Recommendations for 800 Mhz cell phone Yagi antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-07 03:32:23 UTC
From: Tony VE6MVP <tony@REMOVEve6mvp.com>
Message-ID: <q9vvk291tlejemhui3o6mia5v5njggo9kh@4ax.com>
Source record: 49899

Folks

So I'm thinking about emergency communications and it seems to me that an 800 Mhz Yagi antenna would be useful. I have one of those old Motorola bag phones which I use when travelling in rural Alberta.

It works nice especially when on a 3' mag mount antenna on the vehicle roof but it seems to me a Yagi up 20' might be useful at times.

Tony

Just try it. These things don't cost much, do they? Although you
already have a decent antenna.

Compared to the built-in antenna of a typical cell phone, it will make
a tremendous difference.

Here in Norway we have GSM, 900 MHz in rural areas. The signal is very
poor at our summer house. So we bought a 40$ 9 el. Yagi at a hardware
store and put it in a tree, may be 15 ft up. It's supposed to have 10
dB gain, but it comes with 33 ft of RG-58, so we lose more than half
the gain on the way. However, the built-in antenna of most cell phones
is unbelievably bad, and getting the antenna higher up makes a
lot of difference at our location. I went from 0 bars to 5.

The coax is marked "low loss" with nice, friendly letters. I guess
that's what does the trick :-)

Tony, look in the ARRL Antenna Handbook... There will be short yagi designs for UHF... A Quagi would work well and be easy to match, but not as handy to stow away...I suggest 5 elements as the most bang for the buck between complexity and performance... Just scale to your frequency... Use a small aluminum tube for the boom, and bare welding rods for the elements... Put a decent piece of RG8 or LMR400 on it and it should play well...

Source record: 49910

Hello All,

I have just found my old Hi-Gain mobile-mount whip antenna, circa 1980's, I'm guessing.

I have just looked at the antenna and it is made in 4 parts; the whip, the chrome spring that the whip gets screwed into, a metal tube [with a plastic sleeve covering it. could this be the loading coil?] and lastly, the mag base. A small quantity of RG 58 is soldered to the underside of the "loading coil", making a very compact antenna.

If I loosen the set screw in the base and pull out the whip, it is 28" long; I'd like to cut it so that it will receive/resonate center of the 151-174 MHz band. where I do most of my summer monitoring, using my old [but still working] BC 210.

How long should I cut the whip to accomplish this? Or is the whip too short already!?

I wouldn't bother the group with such an easy question, but I don't know where to look for the formula!

Many thanks for taking the time to respond!

Alain

This is off-topic (OT) - find a political Usenet.

Wow, short-memories.

Remember the 1980s and Reagan administration's fight against the
Sandinista Revolution (1980 - 1990) in Nicaragua ?

Of course, most people remember the Iran-Contra affair with Oliver North.
It involved several members of the Reagan Administration who in 1986 helped
sell arms to Iran, an avowed enemy, (1 of 3 "axis of evil" countries) and
used the proceeds to fund the Contras, an anti-communist guerrilla
organization in Nicaragua.

12 years of Republican administration sure did not solve that problem.
BTW, remember Jose Daniel Ortega ? -- received majority of votes this week
http://en.wikipedia.org/wiki/Nicaraguan_general_election,_2006

Considering that there is an unknown coil in the base, I guess a normal formula for figuring the length of the antenna won't apply... I would suggest you take an inch, or maybe inch and a half off the length of the whip and just go with that.... of course remember, it will never be usable on 2M again.

That would work, assuming he has a transmitter in the 150-170 VHF
range he could use as an RF source.

Find a ham in your area who has an antenna analyzer.

Use the ham/analyzer to find the resonance of your antenna. Once it is known, then adjustments can easily be 'gesstimated intelligently'.

I'm in New Hampshire. If close I'll do the measurement for you.

Where do you live? Nearest large city and state will do for info.

If it's an old 2-meter antenna, then I'd guess from the whip length
that it's probably a 5/8-wave, with some form of inductive loading to
make it resonant.

If that's the case, it'll probably receive reasonably well for
monitoring purposes in the 151-174 range without any modification.

Or, you could shorten it by an inch or two, gradually trimming the
whip until the received signal strength around 160 MHz is at a peak.

Another option would be to bypass the loading coil (or whatever it is)
with a wire jumper, and shorten the whip to around 16.5". This will
convert the antenna into a quarter-wave vertical, resonant at around
160 MHz.

That LMR400 is fairly stiff stuff. The biggest problem would be
locating the end that fits on the Motorala bag phone especially with
LMR 400.

I have no idea what kind of end it is but I'm sure a commercial radio
shop can tell me.

Here in the USA, we are losing our AMPS Network next year, so all the
3Watt AMPS BagPhones will be non-functional. Most of us bush Folks have
switched to either Digital BagPhones, or handhelds with external Antenna
Ports and 3 Watt Booster Amps. I use a Nokia Handheld with external
10db Panel Antenna, mounted in an Active Cradle that simulates an RJ11
Jack, and has a Cordless Phone plugged into it. I have a "Line of Sight"
shot at our local Cellsite, which is 16 miles away, (over water) so I
don't need the Booster Amp here. Some of the neighbors need them,
however.

Code is just one part of it. Here's my four step plan that will keep
ham radio from becoming like CB:

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams needs to be raised to 85%.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Step 4: Make the no-code license one year non-renewable.

2050. FCC took 11 meters from Hams and gave it to CB'ers.

Actually what the FCC did was to take the 11 meter band and create the
General Radio Service Class C and Class D.
Class C was limited to only a few channels (6) limited to control and
paging. Class D was farmed out as 23 channels with only AM modulation
and a max. of 5 watts power input to the finals. This was later
modified to 40 channels and 4 watts input.
The classic CB'er came just prior to the increase to 40 channels.

U R, and continue to be, a slow witted idiot.

In college, it was common knowledge to professors that a student needs to hear a new idea six times to learn it (be presented with, shown, etc.) It seems to me, you are taking a bit longer.

Is your whole family as slow witted and demented as yourself?
1) Do you receive disability for a gross genetic mental illness?
2) Did you receive a violent and tragic head injury which has left you in such a deplorable condition?
3) Do you hail from some third world country where manners and morals are left wanting?
5) Were you treated evilly by your parents? Where you molested by a pack of raging homosexual pedophiles?

Really, here we ALL realize there is something terribly wrong, grossly disgusting and evilly maniac which has befell you(downright diabolic!)

Tell us man, we are here to help you! Don't be afraid to admit it and come clean. You already have our pity, although you found the end to our patience a while back.

SC is not a ham..
He has no call
He has no life
If he was a ham he would be out tapping code and enjoying it like the rest of us or working some remote station somewhere.
He is funny..kinda like reading dilbert in the funny papers..

I am also curious as to how he knows so much about CB?

CB aka 11meters does not bother me at all, I do not care what they do down there...

AS for code....some like it some do not...

As for Ham becoming like CBers , we are self governed...we would hunt down and shut down any one breaking the law.

I have observed that two of my family's (various) phones have concealed coax fittings. Look for any bit of peelable/liftable plastic trim on or near the top of the phone that might be covering such a jack.

Dunno what the connector series would be -- there are more different kinds than I can name by eye.

I think I may have observed a coax fitting on the base of one phone. This would be for a unified vehicle adapter, where you slap the phone into a cradle and get power, RF and audio all at once.

I hope this helps.

> Wikipedia

Directory > Reference > Wikipedia continuous wave
A continuous wave or continuous waveform (CW) is an electromagnetic
wave of constant amplitude and frequency; and in mathematical analysis,
of infinite duration. Continuous wave is also the name given to an
early method of radio transmission, in which a carrier wave is switched
on and off. Information is carried in the rhythm and spacing with which
the signal is sent. CW is thus is a form of on-off keying (OOK). In
radio transmission, CW waves are also known as "undamped waves", to
distinguish this method from damped wave transmission
is endangered in the first place?

If you're just going to use it for receiving, you can use it as is. It should work quite well. If, however, you have it set in your mind you need perfection and the value of the loading coil is unknown, you can scale the antenna whip. It probably still won't be perfect, but since it is pretty hard to change the coil's physical properties, this might be the best you can do. Take the center of the band the antenna was built for (I assume 2M band, which is 146 MHz) and divide it by the center frequency of the range you want to convert to (162.5 MHz in this case) and multiply that number by the length of the whip as it exists now (28"), which gives a new whip length of about 25 and 1/8". Give it a try...

Hi all,
KB8HVF here. I am a grandfathered novice, but very new to the ham radio world. My father decided to bring me along to all of the ham classes for the novice level when I was thirteen. I took the test, and passed the exam, but have since dealt with anything remotely related to ham radio. I recently took an interest in listening to aircraft communications at KRDU, and decided this would be a good reason to go ahead and pursue the tech license. Last night I took the exam and passed. As Christmas is upon us, everyone is hounding me about what I would like as a gift. I thought a small handheld would be nice to keep with me to listen and talk to the other hams in my area. I have been looking at kenwood's equipment, specifically their TH-D7AG and TH-F6A models. I also like ICOMs products specfically their battery life (if they have a radio with tri-band let me know). What strikes me as intersting is the APRS function the kenwood TH-D7AG has, but the TH-F6A has the tri band capability. As I have said, one of my interests is listening to air traffic (know i don't need a license to do this :). I also enjoy hiking and camping (sounds like a date ad in the paper), and thought the APRS feature would be nice to have in a radio. If anyone can help me narrow down my choices that would be great.
Thanks,
Kevin

Um, not quite:-) The very presence of the CW signal conveys SOME
information (e.q. the fact that something is out there generating it:-)

It's the turning on and off of the wave that conveys most of the USEFUL
information:-) Which makes CW communication a DIGITAL mode, by the way.

Harry

Get LMR-400 Ultraflex. Much more flexible.
Adaptor cords are available for most any phone from various suppliers.
Try google on "cell phone antenna cord"

I think you will find that cw is making a comeback. Now that the cw
requirement has been serverly reduced, more hams are getting into cw
and it should be starting to make a comback....

Second... I also think you will find that the fcc, and in my country
the IC, are deeply regretting the conversion of 11 meters to 'cb'.
Virtually all of our bad radio operating procedures, of all radio
services, can all be traced back to the bad operating technique found
in the 11 meter cb band....

CW could make a something of a comeback Like AM if it advocates can
learn better manners bothon here and on the air dealing with newer CW
Ops

as it I I suspect MORSE USE is doomed by the attittude of it's
advocates

Hi Kevin

Congrats!

What to get is always a hard choice.

My personal view (probably very different from many others) is that newer radios are actually worse off than older models in many cases. The move towards a single RF broadband design with CPU/software selected frequencies tends to make them more prone to interference (selectivity issues). The manufacturers answer to these issues is then to often reduce sensitivity or make a big thing about DCS! If I was looking at a new device I would carefully sort through the RF performance specs first. My rule of thumb is that if it hasn't got a few RF front end (helical) cavities it isn't worth buying!

I'd suggest that if you are looking for something new, rank what features are important to you and look up user reviews when you get a shorter lost. You may end up having to make a choice based on features rather than RF performance.

Personally I'd take an old IC202 (SSB txcv) on a camping trip if there were no nearby rptrs. If I wanted FM I'd go for the old IC2A with a home made PA. Both these radios are really low on DC power consumption.

Is APRS really that important to you whilst portable? A cheap laptop and a sound card interface will also work well if you don't mind the extra weight!

Apologies for not being specific.

Cheers Bob W5/VK2YQA

Source record: 49858

I have home made antennas for 23cm and 13cm ATV. These are made mainly of copper, Copper clad fibreglas PCB material and 3mm diameter silver plated wire with silver plated N-Type connectors an solid copper coax. I want to protect them from corrosion etc. Is there a paint, varnish, laquer etc. (ideally an aerosol type) that I can use which will not introduce losses? If someone can give me guidance as to what base type - for example acrylic - I should use it would be most helpful. I am always wary of the sprays supplied for spraying vehicles but these seem to be the most commonly available.
Thank you
Dick G4BBH

Wasn't it 4 watts output?

Some more facts:

11 meters was never a ham band by international treaty. FCC allowed hams to use it on a shared basis with Industrial, Scientific and Medical users after WW2. This was done in part as a sort of compensation for hams' loss of 160 meters to LORAN after WW2.

The Citizens' Radio Service was created by FCC in the late 1940s. The original Class A and Class B services were on UHF - right where FRS and GMRS are now.

The problem was that, in those days, the UHF radios that performed well were big, heavy, expensive, power hungry and complex. Simple UHF sets that were small, light, inexpensive and simple didn't perform too well.

The Citizen's Radio service had so few takers at the end of 10 years that FCC created Class C and Class D, at 27 MHz. Low power channelized sets for 27 MHz could be made small and inexpensive even with the technology of the late 1950s.

FCC could take the band away from hams because it wasn't a ham band by treaty anyway. They also argued that the creation of the 15 meter ham band in 1954, and the gradual return of 160 to hams, meant that 11 meters wasn't critical to ham radio.

Add to that the fact that 11 meters wasn't the most-popular ham band anyway. Many popular rigs of the time didn't even cover the band. It

wasn't harmonically related to the other HF/MF ham bands of the era, and in many areas it was full of noise from ISM users like diathermy machines, vacuum formers, etc. Since many other countries didn't allocate 11 meters to hams, there wasn't as much DX to work on 11. And the 1.7 MHz wide 10 meter band was right next door.

Of course hams didn't like losing the band, fearing that it was a harbinger of things to come, but it wasn't. Over the intervening years, we hams got all of 160 back, and three new HF bands at 30, 17 and 12 meters. The cb boom of the '70s came and went, and hams are still here.

These are 'bow tie' antennas. A double quad fed as the corners looking a bit like a figure of 8 and space above a copper reflector. Gives me over 9dBi gain and excellent bandwidth. I use them on their own or as the feed to a simple large mesh reflector system, a section of a parabolic dish in fact.. The 23 cm version has quads of 56mm sides. The reflector is 17cm x 23cm of single side copper clad fibreglass. 13 cm version is directly scaled down in size. See http://www.w6pql.com/23cm_double_quad.htm but mine does not have mesh reflector but the copper clad board instead rather like http://www.vhfman.freeuk.com/radio/23cmantennas.html.

That's funny, the people in uniform doing the clean-up work over there
think we're winning, they can't understand why the democrats and the main
stream media say the things it says regarding Iraq.

Of course now that the democrats have taken over, we have lost Iraq. We
weren't defeated, we'll just cut & run.

Terrorist worldwide, rejoice. Democrats have handed you another victory!

Hi Bob,
Well the APRS really isn't that important. I feel it would be more of
a toy that I would tire of really fast. As for what is important to
me, I am too new to really have any idea of what I might consider
important. This is also something I am trying to figure out :) Sorry
for the ignorance.
Thanks a lot

Ahhh someone has finally spoken the truth. How refreshing. We will always have the one percenters in any hobby, activity or other rallying point. When you remove the barriers to admittance you simply let in more one percenters, so now that one percent equals many thousands instead of the hundreds that got through before no code, incentive licensing etc. Its not the gold coaster filled with pride anymore guys, its become the redneck yatch club. Lets help out and team up with the new guys that are not part of the one percenters and you'll find that most of them would have eventually overcome the barriers. Most of the garbage ends up on 2 meter fm and 75 phone that leaves lots of bands and modes for the real amateurs (no coders included) to enjoy. And that doesn't mean that 2 fm and 75 phone are for loosers, by no means. When you swim in a community pool you just stay out of the nasty end and enjoy whats left. If the non-morons get mad and go away then the whole pool becomes nasty. Stay in the hobby, continue to do it the "right" way (lead by example), have fun, ignore the morons, pay attention to the newbies that show promise and the hobby just might survive. Morphed a bit but survive non the less. I welcome the influx of interest good or bad. Without it we would not be enjoying all the new rigs, antennas and accessories that are now on the market since the manufacturers were dropping like flies when we were more of a closed snobish hobby with dwindling numbers. The yahoos don't quite know what to make of the advanced DSP, high quality RF amps, Ops specific radios like the FT847 or IC910 or other inovations like the 1.2 ghz data stuff etc. but it wouldn't be rolling out of the factories if they weren't swelling the ranks of ham radio with new hams good or bad. C U on the bottom end of 160 and 80 ... or 40 SSB on Sunday mornings .... or 20 PSK mid week ... or 6 during that sudden opening on an indian summer morning ... or 10 FM around the greyline ... or, well you get the picture (I Hope) The new hams are not ALL ABOUT doom and gloom unless we (oldtimers?) let it happen and waste all our time crying about it on the newsgroups instead of being on the air communicating, contesting, experimenting and just plain olde fashioned hamming. Acting the fool (or just sounding like one) on the air and calling it fun is the sport of Morons. Serious, intelligent amateur radio is also fun and can usually be found by just changing the

frequency, band or mode. All in all ham radio is getting better or at least has the potential to get better, bigger, broader in scope etc. as long as we don't waste our time bellyaching about the few that slipped under the ever diminishing radar. In fact before all this new ham bashing I remember we had a proportional amount of bad eggs then as well. We just seemed to either tolerate or take care of the problems in a different way. Wake up amateurs, the only way you loose the hobby is if you let go of the reigns.

There are several good reasons that the Yaesu VX7R is the most popular handheld ever (I think that's correct). The VX6R is also a solidly built, well designed rig and a bit cheaper. I am buying a VX6R for my daughter for Christmas. She likes the slightly smaller size.

Either one is a good choice from a feature perspective. That they both handle multiple reps of the 6 foot drop to concrete floor test is also a great reason to go with them.

> How long should I cut the whip to accomplish this? Or is the whip too
> short already!?

Short out the coil and use length(cm)=7300 / MHz as the total length,
including the bridge over the coil.

You could alternatively use the coil to correct the excessive high.angle
radiation of a 5/8-wave antenna. Use total length(cm)=1860 / MHz including
the length of the turns of the coil. If in practice you find you have less
gain than a simple 1/4-wave then go back to plan #1 above.

Note that these lengths are correct, but reality has a habit of varying, so
cut too long and clip the length for best VSWR.

> * something else?

As others have already mentioned, you have a bit of wire with a plastic environmental sheath. You didn't mention the frequency, but for HF I have each close to trees. The calculated length is about 4% longer than the the actual length requred for resonance, even with more than 3 metres of nylon cord to support the ends.

In other words, the velocity factor of a bit of wire in space is 1. Put it near something and that VF falls a bit. Stuff it in a metal tube and it will fall a LOT, maybe even approaching half (0.66).

As a former user of 11 meters, the Ham Band, this summary pretty much reflects my memory of events. BTW, my old Multi-Elmac AH-54 [if I recall] had 11 meters factory installed. It drifted "slighlty" during each transmission. Slightly meaning 50 +/- KHz. I had to use crystal control to stay reasonably close to any frequency!

My gut feel is that even if an antenna existed that you could buy, it would be a major compromise on (say) half of the bands. Depending on how unscrupulous the seller was they may (say) make gain claims on lobes that are nowhere near in the direction you want! Its relatively easy to load a multiband antenna (for low VSWR etc). Its another matter to make it radiate where you want it to.

I's personally look at the two band market and get two antennas. 2/70 for example seem to have some good designs. If you feel like building have a look at an extended double zepp design with a larger hairpin section.

Cheers Bob VK2YQA

I hope not. The FCC providing unlicensed spectrum for the masses was one of the smartest thing they ever did! Yes, it leads to all sorts of horrible operating practices, but CB and -- more contemporarily -- FRS/GMRS and WiFi had provided *huge* benefits for people (and many millions of dollars in equipment sales) nationwide. I'd hate to live in a country where there's no such thing as a license-free $20 pair of FRS-type walkie talkies or $20 WiFi cards for high-speed Internet access.

I'd say they can be traced back to human nature. People were rowdy and "uncouth" in, say, taverns for thousands of years before CB came along.

the bad part about what they did with CB was providing that band for
and limiting it to local comms when everyone knew it was usable for
longer range stuff this insurred folks would not have much respect for
the rules (wether they obeyed em or not

I'll agree with the uncouth in the taverns part, but, disagree with the context.

CB brought the uncouth out of the tavern and onto the air.

Ah, very interesting. To my knowledge we're not losing ours in
Canada any time soon.

But I also have two cell phones. The small tri band pocket phone and
the bag phone. I've been wondering if I wouldn't be best off figuring
out a good system of using the pocket phone with an external antenna
and only pay for one cell phone.

But also my pocket cell phone is about four years old now. And I
don't want to get stuck with some technology which requires a specific
make and model of cell phone.

If all you are doing is receiving then I suspect that the length
really doesn't matter a great deal. Clearly an antenna half as long
wouldn't hear distance signals as well but that would be about it.

In a lecture meant for his inauguration at the University of Leiden in 1920, Einstein remarked:

"...we may say that according to the general theory of relativity space is endowed with physical qualities; in this sense, therefore, there exists an ether. According to the general theory of relativity space without ether is unthinkable; for in such space there not only would be no propagation of light, but also no possibility of existence for standards of space and time (measuring-rods and clocks), nor therefore any space-time intervals in the physical sense. But this ether may not be thought of as endowed with the quality characteristic of ponderable media, as consisting of parts which may be tracked through time. The idea of motion may not be applied to it."

Shortly before his lecture in Leyden in 1920 he admitted in the paper: Grundgedanken und Methoden der Relativitï¿½tstheorie in ihrer Entwicklung dargestellt:

"Therefore I thought in 1905 that in physics one should not speak of the ether at all. This judgement was too radical though as we shall see with the next considerations about the general theory of relativity. It moreover remains, as before, allowed to assume a space-filling medium if one can refer to electromagnetic fields (and thus also for sure matter) as the condition thereof ".

Perhaps he was correct, you think?

I'm not sure what you mean by half of the bands when the radio only
does FM and on 4 bands only. 10M, 6M, 2M, & 70cm. I don't even care
about the 10M as I'm just a tech with no intrest in becoming a
general.

We have several 6M repeaters around here and it'll do 6M simplex on
50W. A beam will get me a lot of distance.

Of course I could buy an Icom 706 MK-II G and then just get a hor beam
or use a G5RV.

Slow Idiot:

I appeal to you. Perhaps you cannot grasp what we are seeing from your words, let me attempt a better explanation to those presented to you in the past:

Have you ever seen someone in a public place who has something on his face? Have you ever made a motion to convey this to him/her? Did you perhaps see a puzzled look upon that persons face? Did you come to realize they just didn't get it? Did you see the revelation of what you were trying to convey to them suddenly hit home in their mind? Didn't you find they were quickly able to correct the condition and make things right and proper? Didn't you find them a bit embarrassed and thankful to you for helping them?

Or, for yet another example, have you ever attempted to explain a new concept to another individual? Did you ever have that experience where the person failed to get the concept, became confused, and interpreted the data you were attempting to convey them into a totally different concept, or were unable to form any concept in their mind at all? Then, perhaps with further explanation and examples offered from you, they finally were able to grasp the true and real concept. Perhaps then you noticed they were a bit embarrassed from taking so long and appearing so dense? They they apologized for taxing your patience and expending your time and thanked you?

Did you ever consider the fact that the above may be occurring, and is indeed my intention, when I am attempting to convey to you the simple fact that, "U R an idiot?"

Do you realize all we wish is for you to recognize this truth and allow that knowledge to correct your present behavior?

Warmest regards,
thanks for your time,
JS

Drive by the tavern... tune past the CBers? ;-)

I suppose amateur radio is supposed to be more a high-class dining
establishment than a dinner -- suit, tie, and official FCC-approved membership
required --, although these days you wouldn't necessarily know it from
listening to the airwaves.

Hmmm:

You mean you can quickly tell the difference from some self-important, self-worshiping, self-impressed, carried-away-with-oneself personality as opposed to one considering himself/herself to being a student-of-the-world? And, your final implication being, "This group of amateurs is full of the former?"

You present a most interesting observation! <in-a-contemplative-state>

I think it depends where you listen...

This past weekend, I was active in the November CW Sweepstakes. Made
over 400 QSOs in 74 sections (all states except Hawaii). Lots of
activity but nothing objectionable at all.

I think one reason for the relative unpopularity of 11 meters with hams
was that the band was not harmonically related to other bands, meaning
crystals bought for 11 were probably not useful on any other ham band.

We need to keep pointing out their evil. Democrats throw BS out and
ignorant people believe it.

There's a radio show, the host has a person ask simple political questions
to voters on the street. Most of the people are democrats, it's a Blue
state.

It's sad the number of voters that can't tell you the name of the
vice-president, or other simple questions. Informed voters votes are
getting cancel out by retard votes.

I don't know the radio at all! I also never troubled myself to find out what Technician limitations were!

What I am trying to get at is that if you want one antenna to do the job, it isn't going to work as well as three antennas, one for each of the bands (6/2/70) you are interested in. Like a said a dual (or more) band design will be a compromise. This is not the same kind of issue you might get on HF (you mentioned G5RV). Ionospheric propagation on HF is (kind of) happy with a radiation pattern that isn't horizontal to the ground. On VHF/UHF it is very important however to get the pattern as close to the horizontal as possible, hence these antenna designs can be said to be more critical.

If for example you constructed a vertical halfwave on 6m, the same antenna fed on 2m would have much of its radiation going skyward at a steep angle...

This begs the question, do you want to buy or build? There are some nice 2/70 dual band antennas out there that might be a good initial purchase. Have no idea what they cost or how good they are though.

Cheers Bob W5/VK2YQA (Australian in East Texas!)

I think like this. Amateurs look, to me, like a couple of guys who build some equipment (or buy it), hook it to a wire, and communicate between themselves and possibly others. They keep on developing different and sometimes better gear and they learn many uses, games and recreation purposes for it. However, and lately, they make NO moves to advance it, a responsibility the the mere possession of an amateur license places on oneself...

Now, I liken the "wire" in the above to the ether. And, these amateurs NEVER question where the wire (ether) came from, how it works, how long it is, the characteristics of it, etc.

I think, obviously, that any "NEW" and "REAL" discoveries, developments, technology, etc. will ONLY come from answering the question which is implied above or, "How does the ether factor into communications? Will a(the) manipulation(s) of the ether further radio technology, its' use, worth, etc.?"

Now, I do think antennas are an excellent place to begin such studies and research. They obviously, in my humble opinion, interface with the ether! Or, if your belief in the ether is holding you back, I offer the following as an example of hunting for it:
http://pages.sbcglobal.net/webster.kehr/files/Detection.pdf

This page contains instructions on how to construct a cheap and simple device to detect the ether. It uses a laser (laser level--mine cost 12.95 + tax) and a few front surface mirrors... (I am still proving the ether to myself and undecided as to whether to have the same faith I hold for God, for it (ether)...) I would love to come up with a way to use RF.

Point being, DO SOMETHING CONSTRUCTIVE or SHUT UP and go about your BS over the airwaves(vibrations of the ether really!) <smile>

Or, said simply, "Those who can do, those who can't fire up the rig and rag chew."

Trane should be made to fix this and recall all the units that have
been installed. I can pick this interference up on a 2 meter receiver
in my car for blocks. The FCC should bust them if they don't fix it...

I cross posted this to some of the amateur radio groups.

Good point! There are FCC rules regarding interference / EMI and Trane may have flagrantly ignored them. Maybe a threatening letter to the Customer Service Department written with the help of those of us who are amateur radio / electrical engineering types would force them to finally do the right thing.

First, I would get a schematic of the electronics/wiring/specs/and installation instructions for the specific model (web is a good place maybe.) More of a chance the installer has made an error in the installation, grounding, shielding, etc., could save you from the possibility of "crying wolf" too soon... I suspect the engineers of using more caution in the design of the unit, then the installers in the installation of the unit.

Of course, he was correct. Empty space has been
proved not to be empty and certainly appears to
have a structure with particles winking in and
out of existence. The physicists were correct
about the existence of the medium (ether) but they
made incorrect assumptions about its nature. It was
a mistake to assume the ether didn't exist just
because its nature was different than expected.

Mark,

I had a severe interference MF to HF from a neighbours gas heater unit. Not sure what it was that was causing it but it was being effectively radiated by the external cables, power and control. I traced the interference to the unit using a portable rx. I silenced it by wrapping both cables tightly around a 6 inch ferrite rod. The cables held in place by cable ties and tape. Hope this helps.

Quoting "Alpha & Omega", by Charles Seife:
"Quantum physicists are forced to conclude that
the vacuum isn't truly empty. It is seething with
particles and energy. ... The need (to understand)
is more pressing than ever before, because they
think that the energy of the vacuum, the zero-point
energy that is everywhere in the universe, is forcing
the universe apart." That force is thought to be the
same thing as the Casimir effect which has indeed been
measured.

Cecil:

You made a mistake in your spelling, a first (well, maybe!) But surely, you meant the "Cashmere Effect", the effect my suit has on women!

"Dutch physicist Hendrik B. G. Casimir first proposed the existence of the force, and he formulated an experiment to detect it in 1948 while participating in research at Philips Research Labs. The classic form of his experiment used a pair of uncharged parallel metal plates in a vacuum, and successfully demonstrated the force to within 15% of the value he had predicted according to his theory.

The van der Waals force between a pair of neutral atoms is a similar effect. In modern theoretical physics, the Casimir effect plays an important role in the chiral bag model of the nucleon, and in applied physics, it is becoming of increasing importance in development of the ever-smaller, miniaturised components of emerging micro- and nano-technologies." -- Wikipedia

Hey, does an affect cause an effect? Or, is each and every effect is followed by an equal and opposite affect? Geesh, confusing...

... makes me see visions of Fleischmann-Pons dancing in my head, only thing keeping me up is a long tether tossed me from NASA and it might have broken!

Warmest regards,
JS

The passage of time will make that known beyond doubt, the universe expands at an ever increasing (yet, rather slow increase) rate... (Or, what color red do you like?)

What would you see as the affect causing the red shift effect?

Regards,
JS

> What would you see as the affect causing the red shift effect?

We are immersed in relativistic effects and cannot measure or see the forest for the trees. If our velocity is less today than it was in the past, then seconds are shorter today than in the past. If we measure a frequency with a second that is shorter than seconds were when the frequency was generated, the frequency measurement is red-shifted. If we measure the age of the universe with shortened seconds, we come up with a value that is too large.

What if the very first second after the Big Bang was one billion years long measured in present day seconds? Hyperinflation would not be needed. And there would be a drift between carbon-14 years and Bristle Cone pine rings.

This thought occurred to me some 40+ years ago when I made a frequency measurement and the time base selection knob on my o'scope was loose and pointing to the wrong time scale. I measured 30 Hz for the power line frequency.

You're in "Da Nile" ...
you know that river that Bushy thinks is in Libya?

I am SOOO happy my government is no longer in the hands of Troglodites, Neanderthals and pedophiles. Stay the course, indeed: straight to hell.

Long Live Good Government

Republicans can lick their wounds and enjoy all the money they've collected from Abramoff and friends. Head on down to Cancun. They can continue to enjoy their Spa Resort lifestyle.

In the meantime, we regular folks have a lot of work to do to restore government and end Bush's Folly in Iraq.

The test will continue to dumb down because ham radio is dying. There's a new radio game in town, its called cell phone. Like it or not anyone can get a license to use them.

I've been in ham radio for over 30 years. The same discussion is going on today as was when I first started. It has never been settled and never will to satisfy all. Equipment prices will skyrocket as the number of hams continues to decline. In fact they already have. I laugh when I see radio's like an IC-706 that someone is trying to sell on Ebay for $900 plus when only a few years ago new ones were being had at Hamvention under $600. Radio is dying folks enjoy it while the government allows us to have it. There is no "use" for all the Techs anymore.Allthis brainpower should be put together to find a use for your existence instead of continually hashing the same old dead beaten horse.

Cecil:

So, you are committed to the universe WITHOUT a universal frame reference, and therefore the (implied?) Einsteinian Model; but, the Tesla Model remains, yet, to be proven false.

Personally, I favor the Tesla Model (or a near work-a-like); a gut feeling (some "evidence", no real [depends on "real" here] proof) of mine implies it much more favorable towards a condition of holding free energy in an unknown/yet-to-be-measured form and being able to affect the imbalance effect capable of producing/containing some form of kinetic energy on a "self-generating" and subatomic scale of, virtually, boundless proportions (or, what good is an imbalance if you can't measure it?) Something akin(?) to that expanding universe and the "pressure(s)" holding everything apart and having the ability to overwhelm/overcome gravity itself (I mean, if you are going to dream, dream BIG!)

Now, I must disclose a secret (well, alright, it is obvious really), I am a conspiracy nut when it comes to the suspicion that the powers which be would move to suppress knowledge of freely available energy and how to manipulate such an energy source which exists in an manner and form which is "easy" to access and to use in abundant and diabolically-dangerously large quantities of (Or, where is Fleischmann-Pons? Have I lost my tether--why won't you tell me--or at least attempt to toss it again? Is that universe fading from view due to my failing sight? Etc.) Really, I think they would hide such knowledge--I would!

Just imagine middle-east terrorists with the ability to toss out a string and annihilate the world (or just Israel!) Could we already consider it done?

DC motors are notorious noise generators. Those of us who used to be mobile when 6 VDC was the value of a car battery, and alternators did not exist, will attest to the facts of generator [DC motor] noise.

A DC motor uses brushes to contact windings within the motor. As the motor turns the brushes continually make and break current in the rotating armature [inductance]. This making and breaking creates a very wide HF and lower VHF noise spectrum. [Lots of sparks].

The solution, in the olden days, was a coaxial capacitor mounted directly to the frame of the motor with the DC power running through the capacitor. I recall the capacitor was about 1 inch in diameter and 2 inches long. Sprague made such a critter.

Hope this history helps.

Irv:

My first response was only meant to be provocative.

I hear your question as a baffling inquiry composed of the following:

a) What kind of table does space lie upon.
b) What kind of "void" does space, itself, hang suspended in? (floating in?)
c) Does the "state of the ALL" exist as a solution, or an emulsion, a
gas, a solid, etc?
d) Is the ether composed of the smallest particles possible, or are
their smaller particles which the ether is composed of?
e) Is "our matter" which "our world/universe" is composed of the largest
particles possible or, are there much larger particles in existence and
our universe only a particle of this larger matter and would that larger
matter be the largest possible?
f) Etc.

To even propose an answer, I would truly believe in, to what you ask is
impossible for me, at least for me to do so in any real way... I seek

answers and have only questions and possible ideas on how to find answers with.

I often look in others ideas, can you blame me?

Regards,
JS

Cecil:

Surely you jest?

You really want to propose that my yardstick grows longer (has no relation to human body parts, I am sure! Hmm, could this be possibly be desirable?) while my seconds grow shorter?

Hmm, come to think of it, I could measure much larger things in much shorter time spans, could be quite handy, really!

Nice thought, but I went a bit down that road--I'm fuzzy about the specific details but for one reason or another the people that I spoke to didn't give me anything positive. Something about the generation of RF interference not applying to a product like a furnace. Since this has been a problem for so long and Trane has not been mandated to fix it lends some weight to what I was told. I did tell the Trane Rep that I was going to contact someone in higher management (VP etc) and issue a complaint at that level----didn't phase him. Then I put in my cable line and didn't follow up. For those of you still aggravated by the RF noise why not try this route? I guess that if you go the way of the Small Claims Court you probably have to sue the installer as well as Trane and it would have to be for a complete replacement (one without the problem)or a removal and money refunded.

I'm really not too intrested in building. Hands are too shakky.
However I did find a nice Cushcraft tri band FM beam. It'll do 6M,
2M, and 70cm. This is what I want. One antenna. I've only got one

pole. The pole is already there. Its a 55 ft pushup pole. Its not a tower but then my funds are limited. I get maybe $1K per year for equipment and sometimes not that much.

Now I'm thinking of an antenna for the same freqs but for SSB.

I'm pretty sure these motors don't have brushes and are electronically
commutated and the electronics are causing the EMI...

Anything that generates RF inside the USA is regulated by the FCC. If your
cat's butt emits RF in the USA it's regulated by the FCC.

Hi Mark, Modern HVAC, dishwashers, washing machines,ect. use variable
speed drives, which increases the efficiency of the devices. The
increased efficiency produces increased RFI due to the switching action
of the solid state devices (SCR's, BJT's, IGBJT's.ect). My washing

machine drives me crazy on Sat. morning on HF as my maid does the weekly wash. As for what you can do? I don't know, it would require vast amounts of filtering at the drives, I am sure that Trane and other mfgrs are not willing invest in.

This is completely different from the usual thermostat interference, and will be much more difficult to get rid of.
Gary N4AST

Interesting discussion, folks....

As a controls engineer and High-Voltage electrician.... as well as delving into HVAC control of late... here's my observations...

These manufacturers will always take the cheapest route possible and damn the consequences. This is particularly true in power and control systems.

A whole lot of manufacturers are moving toward PWM drives on their blowers in particular. Many solutions are an 'on-board' frequency chopper that is integral with the blower's motor.

These choppers are cheaply built and cheaply engineered. I suppose they thought RFI and EMI would be insignificant due to the control being mounted on the motor... but they're noisy as hell.

Suggestions: Replace the power cables with a shielded, VFD rated cable. Belden makes a wide variety... I think they're called the VFD classic line. Pay close attention the unit and cable grounding. Check to be certain your house ground and neutral connections are only tied together at the service entrance panel of your home.

My 2 cents...

Jake

As Jake said.... with the addition of....
Make sure that you have proper earth grounds for your power, and the HAM rigs/shack. That will go a long way towards eliminating RFI. Make sure that all the bonding screws in the furnace are clean and tight, make sure that the furnace has a proper ground also.
When I put the shack together, I drove a seperate 8ft copper ground rod, and silver brazed #6 solid copper to it, then silver brazed the wire to the copper ground buss on the back of the bench. All equipment grounded.....no problem.

Wrong. If the cat's butt emits RF, it's regulated by the FCC. But, digital equipment used only in transportation vehicles - busses, cars, aircraft - and equipment used in appliances - HVAC equipment mentioned specifically - are exempt from Radio Frequency Device regulations. The rule says "....are exempt from the specific technical standards and other requirements contained in this part. The operator of the exempted device shall be required to stop operating the device upon a finding by the Commission or its representative that the device is causing harmful interference".

As to harmful interference, just because the noise floor rises 20db for 5 seconds on a 50 kHz segment of 20 meters when a bus passes your house, it isn't going to be considered harmful interference. As much as you might like to think that it is, a detectable signal from your neighbors Air Conditioner isn't going to be considered "harmful interference". A carrier that obliterates a specific, used - as in "there's a repeater 3 miles away running 200 watts on 444.600, and the carrier from the Carrier (or Trane) nukes it" - frequency might result in a letter. Just " 'cause you can hear it" ain't gonna cut it.

Hi again Mark,

I think Jake is on the right track, whatever the source of noise inside the unit its the mechanism that radiates the noise that needs to be attended to. In my case it was the external cables, choking them off with ferrite sorted out my problem. To suppress the noise at source within the unit seems a bit hard for me. I also suspect there may be more than one noise source in the box.

Mark:

A quick check of the web turned up a site with posts dealing with the same problem you are experiencing, it seems someone was able to make some noticeable improvements in the rf interference generated--but not totally eliminate... Just might be worth you time time to look, the link I will paste is a long one, if it wraps you may have to copy and paste both lines into the address bar of your browser and make sure there have been no breaks, spaces, caused the whole link. Hope this helps...

Ahhh, Mr. Tom Ring, the number one heckler of Cecil Moore! A personality in his own right, if for no other reason than his imbecilic and insane persistence in this devotion to such petty heckling!

Let me see, there are many, many posts from Mr. Tom Ring to this newsgroup, and these posts span a notable time span. Now, as to the worth of these posts, let us have a look.

It seems Mr. Ring is very good at making some use of the available and current technology. He even has made some recorded voice files available on the net. Seems if questions asked here in the group are more-or-less standard ones, and the knowledge is quite commonly available, Mr Ring is very, very good at looking it up, citing sources and pointing out known and very much accepted, traditional thinking, solutions and methods. He might even be a master at using Roy's little program to plot antenna design specs! Indeed, it might be said he would be suitable to tutor another on and in its' use. And, I do believe he has never failed in being able to match his antenna to his xmitter as a proper load.

But, in my humble opinion, although you may search from the beginning of his posts, here and in other groups or the web, he has demonstrated very little if any real abilities, motivations or offerings in ORIGINAL THOUGHT! Mr. Ring is a bit of a coward, and although any physicist with a valid degree will acknowledge that we are far from having explained, to any complete satisfaction, the workings of electromagnetic waves and their propagation, the medium they exist within, etc., Mr. Ring hides

always in the shadows of others findings, proofs, theories, experiments, designs, etc. It seems Mr. Ring is much, too much a coward to ever stick his neck out and offer any original thought, and this is especially noted if it would require such thought to be against "Traditional Beliefs." Mr. Ring, I suspect, is more of a "YES MAN."

While Mr. Ring may be a devoted member of "The Church of Hardcore and Steadfast Amateurs Devoted to The Traditions of the Decades" he quite certainly will NEVER offer any ideas, theories, experiments or even words against traditionally held beliefs, which even by the sheerest of accidents, would contribute to anything, even remotely, resembling a new discovery, a new design, a new method, a new tradition.

If you want to find plans for equipment someone else has designed, Mr. Ring is your man! If you need antenna advice on any standard and "amateur accepted" antenna, Mr. Ring is your man!

However, if you grow tire of the common, of the already "explored to death", of touted lines from notary figures and wish to try new things, you may expect only ridicule from Mr. Tom Ring.

I can only offer you my personal opinion of Mr. Tom Ring. But, I think you already know what that opinion is, and I will spare you the tirade... I am sure Mr. Ring already already suspects what he is, and seeks to lessen taller men, with his imbecilic heckling, who threaten him with their shadow--indeed, Mr. Ring attempts to silence any thought which would lead to new discoveries--imagine if he was next to Tesla, Bell, Pasteur, da Vinci, etc. in a newsgroup, AND WAS SUCCESSFUL!

A million men might offer clues and make attempts and fail before but one man sees the light and is successful. Just think, that implies 999,999 hecklers might have been right--only one needed to be wrong for a new discovery.

Thank God newsgroups were not in existence, and Mr. Ring present therein when the Wright brothers dreamed...

Sorry, that has been building for a bit...

Regards,
JS

Dunno. I still think time is a man made confarction.
After all, who was the one that determined just how
long a second lasted in the first place. Probably a
hairy man. Who would be the one to decide that the
length of a second has changed value? Again, probably
some hairly legged dude sitting at a desk.
Me? I don't think time exists as we know it. Time as
we know it was conceived by men, for men.
A second can be any length we choose.
Of course, through time as we know it, we have developed
tighter standards of tracking this unit of measure, which
was conceived by man for man. Of course, I imagine the
beginnings of keeping track of time were all solar related.
IE: sunrise, sunset, etc..
Time is infinite the way I see it.
In it's true state, it has no bounderies. In a way, it doesn't

even exist.
My name is not Einstein, but I approved this message anyway.

Interesting enough, I found just such a theory being advanced awhile
back by a "real" university, it sounds preposterous, don't you think?
However, if you happen to have that page, please post it--I should have
at least given it a full read before dismissal...

Regards,
JS

I have'nt seen anything on that. It's just something that pops up out of the
back
of my mind on the rare occasions that I see a discussion on "Red Shift". Now
that you've mentioned it I'll do a web search and see if I can find anything
on the web. Be interesting to see what aspect of physics "they" think might
allow for that "light aging" to occur.

What would you define RF ground as? There seem to be a lot of different ideas.

Yes, the FCC not only has cognizance, but quite legitimately does not want to see products throwing a lot of EMI out which cause you and perhaps your neighbors to have reception issues. If I were at Trane handling Customer Service and was threatened with FCC action, I would react.

Well that's my concern.
There are more and more of these kinds of units being installed
everyday.
We can't "home brew" a fix for all of them.
Someone needs to get to the FCC or to the manufacterer to fix this at
the source before it gets worse.

Except in the case of ground-mounted antennas, there is really no such
thing. There is RF neutral, though.

As you describe your setup it does meet USA National Electrical Code. Your home should have ONLY one earth connection, not two!

As you describe it, your house presumably has the electrical service panel grounded to an 8 feet long ground rod where the service enters the house. You seem to have added a second 8 feet ground rod to your home specifically for the Ham station.

Check with a local electrician for specific compliance issues.

A good "r-f ground" has a very small impedance to the flow of r-f current at the frequency of interest.

A good r-f ground is especially important when using a ground-mounted vertical monopole radiator, because the path to "ground" is in series with the r-f current flowing on the monopole. Power consumed by the ground system is wasted (not radiated as EM energy).

At medium wave broadcast frequencies and in the 160 meter and low HF bands, a system of ~120 buried radials each about 1/4-wave long provides a reasonably low-Z ground connection -- probably 2 ohms or less, regardless of the ground conductivity at the site. This was determined experimentally by Brown, Lewis and Epstein of RCA in 1937.

Copper water pipes in the home, and even buried ground rods typically are not good, low-Z r-f grounds.

But many antenna types - such as a dipole - do not need or use such an r-f ground for efficient radiation.

Amen!
That 'splains it! For a while I thought I have a "problem" :-)

Someone who can only spew "evaluations" of poster's mental faculties here,
without engaging in some technical discussion, belongs do Psycho-Antenna NG.

Those on the west coast can visit Tesla Exhibit in Vancouver BC Nov 16 - 30.
Should be very interesting. If Tesla was around today and posted here, I bet
W8JI would make him look like a F0OL too.

Another small step for Teslians in the (perfect ground) mud of N2EE site,
another large hole in the roof fixed. See www.TeslaRadio.org for some new
pictures.

Actually as I live in a lightening prone area, my home has several earth
grounds as do most of the other buildings in the area.

> As you describe it, your house presumably has the electrical service panel
> grounded to an 8 feet long ground rod where the service enters the house.

The main service panel has 2 ground rods tied to the same buss, The TV cable
entrance has a seperate earth ground, as does the telephone entrance, and
the sub panel in the garage.

>You seem to have added a second 8 feet ground rod to your home specifically
>for the Ham station.

Yes and that one too.

> Check with a local electrician for specific compliance issues.

done did... the sparky is the one that put the extra rods in for the service
entrance and the garage sub panel, and the city inspector signed off on it.

Hello,

Not being an expert, and there are a few here:

If you do not want to spend allot of time building....

I would modify a Diamond HV7A or CR8900A mobile into a base
configuration with either radials to make it a ground plane or two (2)
of them mounted in a dipole configuration.

This would be rugged and efficient.

Regards,

Chris

news:_vydnV0u-L8hIcjYRVnyhg@bt.com...
> What would you define RF ground as? There seem to be a lot of different
> ideas.
>

1. One needs to define properties or "regular" ground.

2. Illuminate it with RF of particular frequency and particular antenna.

3. Study the effect of 1 on 2 and you will get some idea. Amount of
reflection or absorption would be the indicator of how good "RF ground" it
is.

As far as suitability of "ground" to "work" with antennas it is somewhere
from horrible (rocky ground) to "perfect" (sea water, copper mine, etc.)

Other than that, if you can walk or swim on/in it and you expose it to RF,
then I suppose you could call it RF ground.
If there is no RF, the RF ground disappears :-)

Somethinglikethat?!?

--Followed your link and was surprised to see that my comments, posted over
a year ago, are still floating around cyber space. Obviously apparent, that
the Trane RF noise problem hasn't been addressed by them. What is
disconcerting is that they have done nothing to minimize or alleviate the
problem and after more than a year are still producing furnaces with a known
RF noise generating inducer motor. Clearly a case of COST vs Customer
satisfaction---Charge more for the furnace, if that what it takes, and go
back to the motor that didn't have this problem. In my case, I had a
perfect back-to-back comparison--in the morning the first furnace worked
without incident--by noon, the new furnace was screwing up my (rabbit ears)
kitchen TV. I took a look at the new furnace and immediately saw that the
inducer motor was different--size and configuration. With a little bit of

experimentation, I finally narrowed the cause down to the inducer motor. The installer had no clue, was very helpful and cooperative in interfacing with Trane. Since I must have been early in the "new motor" time frame, Trane shot-gunned the problem trying to eliminate it, ----new control board, verifying electrical grounds, replacing the shielded motor harness (the only thing that showed some signs of improvement). I guess at that point they must have figured out that it was a bigger problem then they expected and that's when the Trane Rep stopped returning my calls. It was easier to run a cable line to the TV then to continue dealing with the installer, who was shrugging his shoulders by this time, and the vanishing Trane Rep
MLD

Good. Enjoy your ground loops, and have fun replacing appliances the next
time lightning hits close. Don't even think of surviving a direct strike.

2215. 2 theories on groundplane vertical antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-11 15:06:46 UTC
From: David <nospam@nospam>
Message-ID: <toGdnfiA8JWbesjYRVnyvA@bt.com>
Source record: 49689

Adding elements of the same length to a dipole does not produce much benefit, while in contrast adding more elements as radials to a quarterwave vertical antenna produces a lot of benefit. Many books claim that the radials of a quarterwave vertical antenna form an image. It is said that the greater the number of radials, the more 'perfect' this image is and the greater the efficiency. In contrast, adding elements of same length to dipole increases bandwidth and creates an unusual radiation pattern e.g. fan dipole.

2 theories on vertical groundplane antenna are:

1) Radials reflect radio wave emitted by vertical radiating element. Radials form a ground plane to reflect radio wave. Image theory applies where radials form a 'mirror' image.

2) Radials are simply conductors carrying current, and radiate accordingly. But they are placed and fed so this radiated wave nearly cancels. Radials do not form a flat metal conductor many wavelengths in diameter. Radials do not reflect the wave emitted by vertical. The radials are too short to reflect the wave radiated by vertical.

With elevated radials, the radials are normally a quarter wavelength long. If the radials are proper current carrying conductors instead of a metal reflector, the radials will transform the high impedance at open circuit end to a low impedance at base of antenna. Low impedance means antenna is current fed. If the radials are made a half-wavelength long or longer, does the impedance and SWR of the antenna stay the same?

Are there any tests to prove which of the above 2 theories is right?

Not quite true!

I run 1KW on low bands [75 and 20 meters]. I have a tuner and low pass filters in line. My station is properly grounded to the service panel ground/earth rod. This connection is also the equipotential surface for the operating position.

My station meets ALL FCC requirements.

If a neighbor's tv, phone, stereo, or whatever, picks up my transmissions the problem is with their equipment and I am NOT responsible for correcting the situation. I will advise them regarding what needs to be done at their end and at their expense. The best demonstration is to invite them into my station and have them witness my tv, phone, stereo etc., being interference free.

The best demonstration is an RFI free home station.

We, hams, are not responsible for deficiencies in consumer electronics. That rests with the manufacturer. The next time you buy a stereo read the Part 15 compliance statement!

Most likely it states, I paraphrase, this equipment MAY receive interfering signals from near by transmitters. Buyer Beware!

If you go though old posts dating back to many moons ago, in this amateur newsgroup--and others, you can easily see there is a very defined class system to amateur radio. What may not be openly apparent is that this is a multi-class system. Now, on the surface of it all, one is lead to believe this class system relates directly to the class of license an amateur holds--his knowledge, overall abilities, personality, intelligence, etc. Yet, some within this class system have, and just below its' surface, implemented a secondary class of class system.

This secondary class system relates directly to an individuals ability to produce a system of taps on a device able to key a transmitter, it is more motor skills based than any other skill I can possibly relate it to (like how well one can skate, hula-hoop, hop-scotch, play jacks, hum a tune, etc.), perhaps better viewed, in the light, as someone capable of rubbing his head and patting his stomach with few errors in implementation of the actions and done at a good speed. This secondary system seems to make no note or make considerations of other skills or knowledge which a ham possesses into consideration. Indeed, a severely limited autistic person who had a gift for such tapings, and at least a minimal ability to communicate by verbal speech and text (brag in speech and text?), would reign as king and be supreme leader (worshiped?) In such a class a sheer idiot can brag of genius (and frequently seem to do so.)

When one reads and understands the premise, goals and purpose that amateur radio was first established on, its' charter, it can be seen this class system runs in a perpendicular direction and fashion to the original purpose(s.)

Interesting, and more a statement to human nature, in my humble viewing and assessment, than it can possibly be related to anything else, wouldn't you agree? And, when brought to this light of day and viewed in its' entirety, it stands rather small in scope, would you not agree, again?

Some see this as a rather shallow endeavor and are amused by it. Others seem to poke fun at it in satire. To others, such behavior is disgusting and revolting to their intelligence, would you deny them their opinions?

Regards,
JS

David:

Ground can be a relative thing. What I have always found to be good advice is that EVERY ground, at some point, be allowed to reach a low ohmic earth ground (best possible if it all occurs at the exact same earth ground point--or no current flows and there is no voltage potential between such grounds.) For example, although a dipole needs no rf ground directly at the point it connects to the feed-line, the rig hooked to such an antenna and feed-line should be given a good earth ground.

If the above is coupled with a good understanding, awareness, and practice of avoiding "ground loops", I think one can claim to have a good and adequate grounding system. Ground loops are well discussed in books, mags, and internet pages, etc.

In planes and outer space the earth ground can be ignored, your crafts metallic shell will serve.

>Adding elements of the same length to a dipole does not produce much
>benefit,

Hi David,

Benefit is in the eye of the beholder. Additional elements (I presume
you mean length) bring gain in some directions and nulls in others. If
by adding elements you mean in parallel (AKA fan dipole), then you
stand to benefit in bandwidth coverage. If by adding elements you
mean stacking them |||| then you are describing a primitive beam array
which has classic benefits (once you attend other details of length
and separation).

>while in contrast adding more elements as radials to a quarterwave
>vertical antenna produces a lot of benefit.

This is something of the double-shuffle. What you stand to benefit
from is you are reducing loss, and arguably loss that the dipole does
not suffer from (although there is a lot of room in that statement for
equivocation).

>Many books claim that the
>radials of a quarterwave vertical antenna form an image.

Many books are useful for leveling tables too.

>It is said that the
>greater the number of radials, the more 'perfect' this image is and the
>greater the efficiency.

This "image" and efficiency are two wholly different considerations.
True, these considerations flow from the same design, but one is an
electrical issue of matching and load, whereas the second is what in
the science of Optics is called ray-tracing.

>In contrast, adding elements of same length to
>dipole increases bandwidth and creates an unusual radiation pattern e.g. fan
>dipole.
>
>2 theories on vertical groundplane antenna are:
>
>1) Radials reflect radio wave emitted by vertical radiating element. Radials
>form a ground plane to reflect radio wave. Image theory applies where
>radials form a 'mirror' image.

That is a fairly jejune theory as applied to antennas. You need only consider yourself as being that vertical radiator standing on a literal mirror that is no wider than you are tall.

Look down into that mirror and what do you see? The sky above. Not a very compelling benefit when you are trying to see the horizon, is it? How big a mirror would you have to stand on to see, say, 10 degrees above the horizon in it? That mirror would be quite large, probably 20 times your height.

>2) Radials are simply conductors carrying current, and radiate accordingly.

This is quite true.

>But they are placed and fed so this radiated wave nearly cancels.

Again, quite true.

>Radials do
>not form a flat metal conductor many wavelengths in diameter. Radials do not
>reflect the wave emitted by vertical. The radials are too short to reflect
>the wave radiated by vertical.

As I've responded to point 1 above.

>With elevated radials, the radials are normally a quarter wavelength long.

As a specific statement, yes, but not generally so. Drooping radials are more useful (benefit) but are not the same length as orthogonal radials.

>If the radials are proper current carrying conductors instead of a metal
>reflector, the radials will transform the high impedance at open circuit end
>to a low impedance at base of antenna.

Wire or metal reflector is the same. Wire radials are simply a poor approximation (or better by degrees as the count of radials increases).

>Low impedance means antenna is
>current fed. If the radials are made a half-wavelength long or longer, does
>the impedance and SWR of the antenna stay the same?

No.

>Are there any tests to prove which of the above 2 theories is right?

Common sense comes to mind; however, it is the common sense that is found with experience and a solid base of physics. A quick path to that experience comes with modeling [sic, quick is quite variable].

The confusion of radials as being abstractions of Earth is found in the blur between matching and propagation. Earth and radials are principal actors in those activities, but unless you stand to plant an extremely huge radial field, there are different mechanisms at work.

Clearly, the association of Earth with matching portends loss. In this sense more radials shields the fields from that loss and this can be achieved in the near distance of the antenna. However, you can achieve the same benefit with fewer radials by simply increasing the distance between the antenna and lossy earth: lift the antenna up.

When we speak of Earth as a reflector of waves (the propagation side of the coin of antenna transmission), it is the degree of mismatch between the wave in space and the wave in Earth at a distance that bounces the wave at a shallow angle toward the horizon. This point will be 10s of wavelengths away from the antenna. The wave in a medium of 377 Ohms (free space) meets the ground medium of several hundred Ohms to as low as 10s of Ohms (sandy conditions to swampy conditions).

Here, it is a simple matter of the mechanics of SWR. 377:25 (or 15:1) has a huge reflection component. That is why you want to live next to water (but not in it, which is another misconception that is born of the confusion between matching and propagation). If you live next to a desert, you might experience a condition of 377:250 (or 1.5:1) and your signal is plunging right into the dunes, never to be reflected with any great benefit. The paradox of this is that planting your vertical into the sand is the best of all worlds (when you consider the proximal loss of earth).

Moral of this tale:
Erect the vertical (with a few radials) on a tall sand dune near the sea.

>What would you define RF ground as? There seem to be a lot of different
>ideas.

Hi David,

This is another instance of scale matters. Ground is meant to imply
an infinite resource of charge with no impedance to its flow.

Of course, "infinite" and "no impedance" are factors that are the
first casualties when RF is added as a requirment. This is from the
simple consequence of scale, because distance causes phase shifts and
brings impedance. A long wire that is perfectly capable as a ground
lead for 60 Hz can become a liability to short wavelength RF. That
wire (that we call ground) may connect to an infinite resource of
charge (the proper ground), but that charge can't get to the other end
because of possibly infinite impedances [again, infinite is in the eye
of the creator].

If you can contrive to make that lead to ground half a wavelength long
to the RF of your interest, that wire ceases to offer impedance and
acts much as you would demand of a ground wire. Curiosly enough, it
will never be zero impedance because it qualifies as a radiator (the
paradox of ground) which adds the loss of radiation. For most
purposes, however, it may be your only choice and you live with it.

Now, when we get to the actual mud of ground, and how well it performs
as an infinite resource of charge, RF still brings problems of scale
because that mud will also exhibit impedances correlated to wavelength
(corrected for velocity factors) that disconnect it from the total
earth's resource for infinite charge. This is why you lay down
radials (which simply increases coverage, but never completely escapes
the scale of wavelenght problem).

Moral to this tale:
Put your source (transmitter) as close to the mud as possible;
lay out as much copper as you can from that point to suit
a broader range of frequencies.

Alternative moral:
Put your source (transmitter) as far from the mud as possible;
Use a dipole and insure there are no connections to ground
whatever. Any violation of this last rule brings grief.
Such violations are legion and few escape.

Although the "Universal Time Frame", if it is more than a dream and
exists, would NOT change (taken that it is a law and the ether obeys
such a law.) The speed the earth rotates at, has changed. So, without
doubt, our time reference point has changed; however, we keep
compensating for it.

Stupid thing to base time upon really, the rotation of any specific
sphere... Indeed, from such a reference point even the existence of
time, itself, is impossible to prove. Although time IS an effect of
motion, a second is NOT "time." A second only records the speed and
distance an object moves, in a rather round-about-measure.

Source record: 49705

Good afternoon...

Anybody know where I can find some formulas or design information for designing coax traps for a dipole?

I've seen some articles on coax-trap antennas but the traps they use are too big. I need to make some traps for 40 meters that are narrower (but, longer is OK) than the ones I've seen in the articles.

(A thought I had was perhaps using RG-174 instead of RG-58 ... these will be used at low power only, 10 watts max)

High Q and narrow bandwidth is OK. These traps only have to resonate at one specific frequency.

Any thoughts or advice?

Thanks...

At the time "CB" in the 27mhz region made sense because UHF equipment
was too expensive to build for the masses. That's no longer true. The
FCC should eliminate the 27 mhz CB service before the start of the next
sunspot cycle and force everyone there to move to UHF. One of CB's
biggest problems was interference from 'skip' (DX), and it is illegal to
work DX stations anyway.

I assume that to mean a parallel LC circuit where the L is mainly formed by the inductance of the outer of a coax cable, and the capacitance is mostly formed by the inner to outer of the coax cable.

The programs that I have seen assume that the impedance of a short o/c transmission line stub is purely capacitive and has a constant capacitance per unit length.

Both assumptions are wrong, which is why these traps have higher loss and are wider band (both inextricably linked) than predicted by those programs.

>one specific frequency.
>

You could wind a traditional solenoid with thick copper, and use a quality fixed capacitor. Short o/c stubs of lossy coax make for lossy reactors.

Try the calculator at http://www.vk1od.net/tl/tllc.php to find the input impedance of 3m of RG174 with a 100MOhm load at 7MHz... I get 1-j64, so it is a 64 ohm capacitive reactance with a D factor of 0.016 (or Q of 64). You should expect an order of magnitude or more better performance from a quality fixed capacitor.

But they "work". The benefit of wider trap bandwidth and less critical
tuning are at the expense of radiated power.

>

The selection of 7MHz for the above example should not be taken as a
recommendation that traps be resonant at one of the frequencies of
"operation"... in fact it is usually better that they are not operated
at resonance.

I also had a quick look at Reg's COAXTRAP prog. On an trial for a trap
at 6MHz using 5.2mm dia line, it came up with a resonant impedance of
187kOhms which seems very high. I make the 1.8m of coax o/c stub
bringing around 34kOhms of shunt resistance alone, so resonance
impedance should be less than that, and more likely less than 20kOhm.

Programs tend to underestimate the losses of these traps.

Actually, most of the stuff being talked about here is exempted by the FCC
from testing. Basically, any digital stuff in appliances, and vehicles is
exempt from showing compliance. That doesn't mean it's allowed to cause
harmful interference, but the exact definition of "harmful" is a grey area.

C.J.

You can design the antenna and the coils using Hamcalc. Hamcalc is a collection of GWBASIC programs that run in a DOS box in Windows. It includes over a hundred programs that do a variety of ham calculations. The collection is free and is updated regularly. No changes to your registry, source included and no spyware!!

Available from http://www.cq-amateur-radio.com/HamCalcem.html

Exempt from FCC compliance testing but not from Part 15 compliance.
Intentional and Unintentional radiators must comply with Part 15. There
is still a permissible level of signal emitted under this Part i.e.
Unlicensed two way radios.

The aging of light is one of those strange concepts often brought out
by creationists as an attempt to make the universe "younger" in order to
fit in with their worldview.

One contradiction to that theory is the fact that while most distant
stellar objects are red shifting, there are also objects that are blue
shifting on us. Galaxy Andromeda comes to mind. So if redshift is to be
refuted, blueshift must also be explained.

Another issue is that Doppler effect, the basis of redshift, is so
easily demonstrated on so many scales - sonically, and
electromagnetically, that one would have to have a really strong
argument to refute it. I'd be interested in hearing the arguments though.

Danny,

I recall modelling dipoles incorporating such traps with NEC some time ago. My recollection is that the loss is of the order you suggest, which might seem insignificant in the context of a path budget, if it wasn't for the fact that it might about to a significant amount of power to be dissipated in the trap, depending on the power level / mode.

Operation at resonance exacerbates the situation.

My sentiment is not so much that the traps are a bad idea, but the design tools that are around seem to take shortcuts and are inconsistent. The design tools would make one think that the trap designs are better than they really are.

I tried Reggie's COAXTRAP and compared the predicted inductance with his SOLNOID3, and they differ by a factor of 4, and SOLNOID3 produces the more believable result. I don't know why that would be so.

You might also consider putting the multiband FM beam antenna on a bell crank arrangement to give it changeable polarization. Depending on the antenna the performance at the SSB end of the band may not be superb, but the polarization change will get you in the ball park.

I had a 5 element yagi on 2M that normally mounted in front of a mast. I loosened its pipe clamp and pushed the boom back, then attached a diagonal brace to where it protruded behind the mast. Two pieces of rope then solved the polarization change!

When you refer to hooking the rig/dipole to a good earth ground, are you
still talking about an rf ground, or a safety ground?
I see no requirement to connect a nicely matched dipole to an earth ground
for rf purposes. For example, a battery operated transmitter feeding a
dummy load wouldn't need one either.

2258. Re: Need design info on coax traps for dipoles

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-12 02:04:47 UTC
From: Roy Lewallen <w7el@eznec.com>

Source record: 49631

For another data point, I made a number of coax traps using RG-58, and measured the L, C, and Q. I don't have the numbers handy right now, but using the measured values I looked at overall loss when used in antennas for various combinations of bands. In most 3-band configurations, there was one band where the loss was a couple of dB, and not necessarily the band where the trap was resonant. Some 2-band configurations were ok, some not.

On Field Day, I sometimes use a supplementary 3-band dipole arrangement pointed N-S for California -- my main antennas point to the east. It consists of a 40-15 trap dipole, with a 20 meter dipole drooping under it as a separate inverted vee but connected to the same feedline. With RG-174 traps, the loss is tolerable with the 40-15 combination, but not with 40-20-15.

Trap loss when used in an antenna is a function of many factors, and there's really no practical way to determine what it'll be except for modeling. Of course you have to know the equivalent L, C, and R or Q. You have to check it on all bands, since it might easily be ok on the band where it's resonant but lossy on others. Way back in 1998 I did a brief study of the effect of L/C ratio on trap loss, assuming a constant trap Q. The results, along with the EZNEC models I used, are at http://eznec.com/misc/ as traps.zip. I haven't looked at them for years, and see that I used Laplace type loads, since this was done before EZNEC had RLC type loads available. Modern EZNEC has a special "trap" type RLC load with the R in series with L, and C in parallel with the combination, and with the ability to make R vary realistically with frequency. Nonetheless, EZNEC users might find the models useful, and others might be interested in the results given in the accompanying text file. Note that the Q I assumed for the study, 400, is probably better than you'll see with a coax trap.

No matter what kind of trap you make, it's essential to keep water from getting between the turns of the inductor or coax. Letting that happen is guaranteed to trash the Q.

Wayne:

Both. Only a dummy would think he needed an rf ground for a watt burner
of proper impedance.

However, there always is that "special case;" if the nitwit was running
a kw off a forklift battery, he just might want that rf ground.

An RF ground is where RF energy flows into the earth. A lot of folks misuse the word "ground" when they really mean a common connection point, which may or may not have anything to do with earth. Be careful to define just what you mean.

If your mind is set on coax traps, ok, but you might consider something different. W9INN uses what he calls a "resonactor" in his trap dipoles and I think they are far better. Basically, they are just a single layer coil which is carefully trimmed to resonate at the desired frequency with its own self-capacitance. There is no other capacitance needed. The advantages are two: Very low loss and very high power handling capability. I have run 1500 watts of RTTY under contest conditions for years into mine with no problems at all. Conventional traps, whether L/C or coax would probably have given problems my now with that power level and type of operation.

You do need a grid dip meter to tweak them, but that is true of other traps too.

W9INN is now an SK, but his ideas live on.

Bill, W6WRT

There doesn't have to be any motion. A second is just an arbitrary
measurement given to a certain amount of elapsed "living time", by
some hairy legged man. An object could move zip in that second, or
it could move up to 186,000 miles if light. Of course, some will argue
light is not an object per say. Time is probably one of the most brain
warping things to think about. Time doesn't know it's time. Time
is never late. Tiiiiiiiiiiimmmmmee is on my side, yes it is...
Of course, man may well have needed to measure the speed or distance
of something to have a decent reference point when measuring time,
but thats their problem, not time. Time could care less cuz it's
infinite.

Code or no-code it's largely been a bunch appliance operators having
their "slam bam thank you mam" QRM contests for the last 15 years. The
no-code situation is just going to exacerbate this. Just refer to it as
"CB extra class!"

But the power-handling capability of that wire is much less than that of the earth below the tower ;-) It would be a tad better at not exploding than a 20AWG wire would, because it's more massive, mostly, but I don't know that I'd want to use it as a primary grounding conductor anyway.

I don't know about that! I had some work done which involved an upgraded service entrance and new breaker panel. The electrician added a second ground via a ground stake beneath the panel, despite the original (1967) ground via the cold water inlet pipe being intact and sound.

(I will concede that he didn't quote chapter and verse in the NEC; he may have been following a local code requirement. I know he wasn't padding the bill, as he was doing the job at the behest of my son, from whose business he was buying his supplies. (Still does.)

Roy,

Sure. I should have mentioned that after trying NEC models to get a low VSWR solution for just two bands (one twice the frequency of the other) I gave up figuring that it was likely that an ATU would be needed in any case, and the traps were just an unnecessary complication.

As you know, trapped antennas are sometimes explained by considering the traps to be equivalent to frequency selective switches that are o/c or s/c at certain frequencies of operation, and conveniently disregarding the conductors on the outboard side of the o/c switches. It is a simplistic view, it does not lead to a design that works, nor does it explain designs that do work, but it remains the most popular explanation to be heard on air in my experience.

Owen

SC,
`Sounds to me that someone likes to stir the pot. . . Are you one
of them "Sensationalist" who like to do that? To see how much hate
and discontent one can whup up in the shortest amount of time?

This is a topic, much like abortions nowadays. . . There is no one
real answer and at any level, it's not that easy to answer. However,
I have a different approach to things:

Make the CB band licensable by a competency test and money for the
license, just like everything else on the radio level of things. That
way, the HAM's of who have heartburn of anybody NOT paying their dues
will have instant relief from their most personal, but most publicly
proclaimed issues.

I'm a technician class operator. Nothing special what so ever. In
fact, some even claim that to be nothing more than a Posh CB'er. . .
So what? I took the test and paid my bill. . . Whoopie-ding! I can
operate 2 meter and up. This is where it starts to get crappy:
I can howl and carry on, on the 11 meter band, (CB), or I can talk
to real "Jabber-Jaws" and "Drool Monsters" all day long on 2 meter,
(Just as bad or equal to CB'ers.) I can talk on higher frequencies
all day long with no issues, but to go UNDER 11 meters for Any reason,
I have to have a license that sayz that I can pound on a key in the
manor of reason to convey conscious thought to another. . .

Hey, check this out:

I don't want to `Key.
I don't have Any intent ever to `Key.
I am interested in phone FM and Sideband
Did I say that I'm not interested in the Key? And that I prefer
Phone?

So, what this amounts to is some old farts with a feather to wave in
the wind and listen to it whistle insists that I HAVE to learn the
"Key" before I can do what I want to do. And because they are LOOSING
PEOPLE AT SUCH A PROFOUND RATE, they had to drop the "Code
Requirement" to a REDICLOUSLY LOW SPEED of only 5 Words Per Minute!

FIVE WORDS PER MINUITE! Just to force me to do something I have absolutely NO interest in what so ever, Just so they can hear the wind whistle through their stupid feather! . . . Five words per minute is just about worthless and truly amounts to nothing more than some one forcing another person to do their bidding for no other reason that to make it so.

It sounds like the "WeSaySo" corporation is in control of the FCC. If this continues, just to keep people interested in radio, enough to be able to FUND the governmental HOBBY, I can actually foresee the requirement to be dropped to the level of:

1. Learning to key in "SOS" and "Pon Pon"
and
2. Showing a basic understanding of the "Q" codes
and maybe
3. A Two Dollar Bill bribe simply to accept the damn license to justify the departments HAM branch very existence.

The big issue is something I can put into two simple words, "Cell Phone". As a governmental person calmly explained to me, "Who the hell cares about HAM radio anymore when EVERYBODY has ether a satellite or cell phone?"

The only argument I could place against this as a retort is: "But it's a state regulated hobby." . . Boy! Now THAT was an argument, wasn't it?! That stopped the official with a silly smile on his face. . . Just before he broke into a laugh.

SO, I challenge YOU, Mr. SC, to do any better in trying to uphold the unique and special place that the HAM radio operators Use To Hold, nowadays against the onslaught of the cell phone landslide. . . (No license, no test, just push a button and talk around the world. . . Smile, its simple! Just PAY THE BILL.), against the hassles of fees, testing, and pointless bullshit of just trying to be a HAM and trying to set up an antenna. . . NOT to mention Having to learn a completely obscure and arcane language of pulses, NEVER TO USE IT, but just so one can simply to "TALK" like on a Cell Phone for the pure sake of enjoying the arcane hobby of HAM radio?

Who needs the stinking headache from all the old feather-waving-bozos when the HAM aspect of the FCC is dying for lack of interest due to cell phones and the internet? Bottom line is that the human race doesn't care about old shit nowadays, and HAM in that light, is WAY ancient!

Forcing one to learn how to use Morris Code simply to use the Phone bands of the frequencies is honestly some real petty bullshit put in place by seriously demented, egotistical, fascist type of people. The only purpose of this exercise is to allow these bullies, these Committee members, to achieve an ill gotten and poorly timed erection by saying "NO" to the rest of us, and making it stick. Nothing more

purposeful than simply preventing people, stopping people from doing what they care to do, simply by exerting their poorly derived authority.

As far as I am concerned, KEY is just as much a hobby as anything else is. Open the bandwidth to all, but reserve some bandwidth strictly to KEY and no body else. Stop forcing people to learn what they do Not want to know or have the time to learn, especially when they have absolutely NO interest in it, and it has absolutely NO bearing on the their ability to function with their equipment.

Leave some bandwidth for KEY only, but don't shut off entire bands from me just because I have no interest in Keying anything to anybody.

We might finally be able to breathe? Lock yourself in your garage for a short while with you car idling, you won't come out. Picture yourself streaming down the highway where uncounted cars have just preceded you, and are just preceding you, do you see the virtual "river" of toxin you are traveling in; do you see it drifting towards your neighborhood?

I do NOT wish to stop driving, I only wish to stop dying to do so... without doubt we are in Iraq because of oil, no matter it reflects a type of insanity to be there?

Still, now we ARE there...

2289. Re: What is RF ground?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-12 15:14:49 UTC
From: Dave <noone@nowhere.com>
Message-ID: <SfGdnZ76PI_2p8rYnZ2dnUVZ_h2dnZ2d@crocker.com>
Source record: 49663

but rf doesn't flow 'into the earth'. rf current is always trying to complete the circuit back to it's source... i.e. 'ground radials' under a vertical are collecting the current and returning it to the feedpoint, so they are actually 'sucking' rf out of the ground. the 'ground' connection to a radio feeding a dipole is actually returning current from the ground back to the feedpoint via the outside of the coax shield... that is why you can get high voltages at the radio end of the cable, if too much current is coupled from the antenna onto other conductors connected to 'ground' they will feed current back through the radio 'ground' and out the shield of the feedline to get to the feedpoint, and if you happen to be too close to the antenna or some other object that couples the rf to you then you get burned when the rf from you flows back to the radio when you touch something that is 'grounded'.

Are you that fucking stupid and simplistic?

Here's just one point, and of course, as usual, you'll have no legitimate reply:

Minimum wage. The GOP states that if the minimum wage is increased, the cost of everything will rise. Probably so. Of course keeping it low means that things will cost less, right? Let me see, if we give people a wage that they can live on, we'll have less people getting welfare, right? Sure, the cost of a hamburger may go up, but then again, I don't actually need a hamburger, so I can live with that. And the taxpayers will be getting a break in the form of less people on welfare. That benefits me and you, right. Stick with me here SC, I know this thinking for yourself stuff is hard for you, but I'll try to take it SLOW. These same people will have more cash to spend, so that helps the economy, right? So, if you and I benefit from an increase in minimum wage, who loses? Well, it appears big business does, doesn't it? They are the ones reaping the benefits of low labor costs, while at the same time raping you and I because their employees cannot sustain themselves because of an artificially low labor cost.

This is just one point, SC. I know you're out of your league debating, but do you care to try to dispel this fact?

> whatever. Any violation of this last rule brings grief.
> Such violations are legion and few escape.
>

Hi Rich

This knocked the gerbil off his wheel

so if i am doing the above, do you mean, no coaxl shield to ground or
did you really really mean not even a ground to my rig chassies?
i understand the dipole is ballanced at that point and the antenna
dosn't need a gnd (plane) radial (min is a center feed equal l)

so i would just have a rig and antenna nothing else??

(presume my electrical gnd is ok on the aka 3prong plug)

2298. Re: 2 theories on groundplane vertical antenna

From: ml <m@di.net>
Message-ID: <m-D1E7D7.11232312112006@news.verizon.net>
Source record: 49673

i have a few known good hf rigs. after all is hooked up i notice over time as i've made 'hookup' changes... that i seem to dectect rf energy leaking from somplace

it might be the case or my coax perhaps the grounds lastly it's possible rf is just going into the ac lines

I know this as my tv in the room hasn't changed and lately is pickng up rf on keydown (i've isolated to not being from my roof antenna)

sometimes when rig a is on i can pick up a little of it from rig b (even w/a bandpass filter) so it's shack related

Question:

so how does one go about finding out what i did wrong how do you trouble shoot? and isolate

can i use a instrument? trial and error?

How about a positive suggestion?

I think that when we call anyone we should always identify our stations in CW. There is no requirement to use SSB to identify when on SSB. So, try using CW for all station ID requirements.

BTW, I'll slow down to 20 wpm.

Any interest?

I hope that didn't take you a LONG time.

> I know this as my tv in the room hasn't changed ...

The only change you will ever see is, it grows older and outdated.
But, I am curious, what changes have you seen occurring with the tv's in
your other rooms?

> sometimes when rig a is on i can pick up a little of it from rig b

Apparently, you have long arms. Why you can only pick "rig a" up in
such a sporadic fashion and time frame baffles me. Again, I am curious,
can you pick "rig b" up from "rig a" any more consistently?

> so how does one go about finding out what i did wrong ...

My crystal ball is non-functioning at the moment, perhaps another can
assist you?

> can i use a instrument?

Perhaps, give me a clue, are you a musician?

2310. Re: What is RF ground?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-12 19:07:27 UTC
From: Richard Clark <kb7qhc@comcast.net>
Message-ID: <d7rel21nc77seb603avi6b4i4slgh4vscv@4ax.com>
Source record: 49584

On Sun, 12 Nov 2006 15:14:49 -0000, "Dave" <noone@nowhere.com> wrote:

>but rf doesn't flow 'into the earth'.

Hi Dave,

That statement is contradiction to the following:

>'ground radials' ... are ... 'sucking' rf out of the ground.

It necessarily follows that RF does flow "into" the earth by your own admission of it coming out (by whatever means).

>the 'ground' connection
>to a radio feeding a dipole is actually returning current from the ground
>back to the feedpoint via the outside of the coax shield...

Very true. However, the ellipsis (...) elongates a 25 word statement into an 118 word run-on sentence:

>that is why you
>can get high voltages at the radio end of the cable, if too much current is
>coupled from the antenna onto other conductors connected to 'ground' they
>will feed current back through the radio 'ground' and out the shield of the
>feedline to get to the feedpoint, and if you happen to be too close to the
>antenna or some other object that couples the rf to you then you get burned
>when the rf from you flows back to the radio when you touch something that
>is 'grounded'.

If I try to parse the intent of this, it becomes a string of assertions held in suspension until the summary that ties them together. That never happens. The conclusion:
> then you get burned
>when the rf from you flows back to the radio when you touch something that
>is 'grounded'.
bears no relation to the matter of currents in the earth - except as a consequence to rather perverse conditions.

>Both theorys are wrong...

Hi Denny,

>I am adding an element to a dipole, this afternoon... I expect
>significant benefits...

Expectation is described in terms of a belief system. Many adherents
to belief systems stand the risk of disappointment, but that does not
invalidate any particular theory, only the belief (a very subjective
thing). Many adherents to belief systems find solace in their beliefs
alone (without any further attempt to quantify).

>I am not adding any radials to my vertical antenna as there will be no
>measureable benefit...

No "measurable" benefit is described in terms of ability. Many are
unable, but their shortfall in capability, too, does not invalidate
any particular theory (doesn't validate it either).

++++++++
Yeah, its a shame that they all do not have the splendid military service as displayed by Rush Limbaugh (none) and Sean Hannity (also none), Karl Rove (also none) or our fearless VP, Dick Cheney (no service, but did bag an old lawyer friend on a hunting trip).

But what good is military service any more? The military gave up CW years ago, and nobody in the military practices or knows it any more. Just a bunch of CBers riding around in Humvees, right SC?

in context of the message i was replying to the writer implied that rf
flowed 'into' the earth and that was the end of it, more correctly it could
be said that rf flows 'through' the earth, but it doesn't dissappear 'into'
the earth.

it relates to the common assumption that the radio case, coax shield, and other items connected to a common 'ground' are at 'rf ground'. ignoring the 'earth', there is also the common misconception that things tied together to the often discussed 'single point ground' are all 'grounded'... something that is not necesssarily true when dealing with rf.

Usually there are good reasons to connect an earth-based tx chassis to an earth r-f ground. But if the tx is feeding a dipole or other balanced radiator, that radiator doesn't need or use a connection to an earth r-f ground to generate its radiation. The current source for one side of the dipole is the other side of the dipole.

For example consider airborne VHF tx/rx/antenna systems -- which work just fine with no reference to an earth "r-f ground," whatsoever.

Hi Myles,

Let's just cut to the chase with some selective editing:

On Sun, 12 Nov 2006 16:14:21 GMT, ml <m@di.net> wrote:

>> Any violation of this last rule brings grief.
>> Such violations are legion and few escape.

>(presume my electrical gnd is ok on the aka 3prong plug)

B I N G O !

You have won the traditional violation of the rule. This is the
meaning of "legion," there are many, many, many such examples. Those
who violate this rule are often blindsided by other violations along
the way.

What is the third prong of the 3 prong plug for? Most would say
ground (and be blindsided to the complete term being "safety" ground).
The 3rd prong is not designed to be current carrying in the
conventional sense, only in the safety sense when the neutral wire or
hot wire becomes exposed to the device user (basically forcing a short
circuit that then opens through a blown fuse).

So, you have TWO paths to ground:
1. Through neutral;
2. through safety ground.

The question becomes:
"What is the quality of it being RF ground?"
Answer:
"Neither 1 nor 2 above were ever considered
in those terms. Hence the quality of their being
RF ground is unknown and the presumption of being
poor examples is a reasonable expectation."

The next question becomes:
"Why do I need their ground proximity?"
Answer:
"You don't - unless...."

Unless
1. You are powering off the Mains;
2. Powering off battery that is being recharged off the Mains.

Both numbers 1 & 2 are a frequent blindside to those attempting to
isolate ground loops.

>trouble shoot? and isolate

Hi Myles,

This, again, goes to issues of ground loops (I bet you're tired of hearing that).

What interference that does not arrive through the air, must arrive through a wire. This second form is by conductance. If you share a conductor, you will also share some of the RF at that common point, especially if that common point is elevated above a true ground.

To understand what it means to "share" a conductor, you have to think outside of the box. Look at your entire home/apartment/building instead of just your rig and the wire to ground. Few ever step far enough back to visualize the complete picture.

In that complete picture, your rig is being powered through a connection to a wall plate that eventually finds its mains connection at a breaker panel. If you were to consider the room (partially outside of the box of rig and ground wire), you can (with x-ray vision) see that conductor behind the wall tracing its way through probably half a dozen other wall plates powering your computer in that room, several lights, perhaps your modem, another charger for your phone (yet another ground loop path to Ma Bell's ground), perhaps a digital clock - need I go on?

If you turn up the x-ray vision to go further outside of the box of rig, ground wire and shack, and look at the home/apartment/building, you might see that conductor winding through the rooms to pick up connections to your furnace control, maybe the door bell transformer, and passing through the living room to power your TV and FM radio (they could be on the opposite side of the wall of your shack). Then after this winding around, it might finally hit the breaker panel. You might also find your Amp is sharing the same panel circuit as the kitchen range or your clothes dryer (more ground loops opportunities there).

If your transmitter's power source is at the far end of that long trail back to the panel, all those connections along the way are sharing the same conduction leakage from your source. It doesn't take much to make your TV image swim with modulation, or for the FM to go screwy, it can also pulse your lights through their sensitive dimmers.

How do you cure this problem of conducted interference?
1. Break the path,
2. Shorten the path,
3. Change the path.

Basically isolate your RF activities to one breaker at the breaker panel. Because all mains powers branch out from this point you are simultaneous doing all three above when you choose one branch and dedicate it to RF.

This requires you to map out every power switch and wall plate in your home back to their breaker in the panel. With this map you are then informed as to which devices might share the RF conduction path, and you can then move either the devices, or the choose another RF path.

A simple test as to the degree of coupling of this conduction interference is to simple choose one device that is especially sensitive. Let's say it is the TV (and by that I mean the display and ALL of its accessories like cable connection, Tivo, VCR, sound system and the rest) and plug it into an extension cord that is in turn plugged into another wall plate on a DIFFERENT branch. This often means a long extension to another room, or better yet, to the outlet nearest to the breaker panel.

This is why curing ground loops is so frustrating.

Hi Dave,

True, but knowing Bill, I doubt his description was meant to be so
literal as to having current disappear into the earth.

In the sense of RF ground, already described by me earlier, ground is
a pool of infinite charge and as such current into it does disappear.
Otherwise, it would perturb and become less than a ground, its
potential would elevate and that elevation would be in reference to
some other ground.

This is a true picture of the reality of ground as such perturbation
does just this, and is evidenced by local variations of potential to
other "grounds." However, this reduces the discussion to one of
infinite regression and over-qualifies an answer to the primary
question.

>i have been told before that i have very long trains of thought, usually i
>am just trying to be descriptive enough for someone else to follow along...
>and i just like ellipsis.

Up to the ellipsis was fine. The better part of writing is what you
leave behind after you trim off the fat.

>it relates to the common assumption that the radio case, coax shield, and

>'earth', there is also the common misconception that things tied together to
>the often discussed 'single point ground' are all 'grounded'... something
>that is not necesssarily true when dealing with rf.

I can follow the argument for concern, but you really don't offer any
context. There are far more examples of grounding working than not;
and your brush has tarred them all equally.

There is the practical answer to the question of RF ground, and there
is the literal answer (or academic, if you prefer). The practical
answer might have the user elevated hundreds of volts above academic
RF ground. That user might never perceive it in any way because the
user may have contrived to build a virtual ground that satisfies all
the requirements for operating without suffering themselves or any one

else.

Richard:

I have been "short" with some because I suspect they "pull my leg" a bit. I have no problem with the example you cite. However, if someone is at the point where they really need to ask, better for them to be overly cautious and "overly grounded." It would bother me is someone was injured or worse from some oversight of mine, something I was not clear enough on. And yes, I realize that even attempting to avoid such errors, I may make them.

So, we agree...

Judging from many of your previous posts, I have to wonder if you ever
did.
Why would I remind you of your younger years? I'm a 50 year semi old
fart.
What makes you think a "second" has to involve distance or a certain
speed? I can spend one second sitting in this chair, not moving, or
I can spend it in a car doing 70 mph. A second is still a second.
You disagree that time is infinite? I bet it is. There may be no worlds
left as you know it, and the stars may be in different places, but
"time"
will still be ticking away. Forever and ever and ever.
As far as "knowing it all", who said anything about me knowing
anything?
I'm just giving my opinions on time the way I see it. I may be fairly
close,
or I may be totally wet. But if you don't like my answers, it "time"
for
you to kiss my ass. I don't like a smartass. And your track record for
being one is proven over *time*.

Hello "Antenna-Lovers",
How do dual-band antennas work? I bought a COMET
"SSB-7" antenna for my mobile radio. It worked great for a year or more
and then,trouble. I don't know "HOW" to trouble-shoot it.
Where on the antenna can I check for "continuity" or somewhere I can
look to find a "fault" of sorts.
It costs a bit more than a lower gain antenna. How can I trouble-shoot
it ?

Time falls into a group of concepts "discovered"
by man.

Did time exist before man existed?
Did God exist before man existed?
Did truth exist before man existed?
Did infinity exist before man existed?
The list is virtually endless.

At 54 years old, I do believe I am your senior. At 54 my father "acted"
very much like he was 54--it only pleases me you find I do not. And,
don't bother bowing, I know a few college students which are my equal,
and a couple my better, they only suffer from the lack of my experience
("time" on earth you would say--worldly exposure I would say.)

If you wish to prove time to me, or anyone else for that matter, you have but to show me or propose a demonstration/experiment where it can be seen and measured. However, and remember this well, the demonstration/experiment you propose MUST NOT reference movement and/or distance--as that is what I am admitting are the only possible things our clocks CAN measure.

Now, as to your dislike for responses from a "smart ass" like myself, easy to fix, don't act, speak or text like a "dumb ass" and you will NOT experience the former from me...

Regards,
JS

> I'd be interested in hearing the arguments though.

Take a look at Lorentz's transformation equations.
The physical dimension increases as velocity *decreases*.
So an increase in a physical dimension doesn't necessarily
imply an increase in velocity. When relativity is involved,
it implies a decrease in velocity. Thus, decreasing
velocity can cause a relativistic red-shift.

2338. TS-440SAT vs. AT-180 tuners

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-13 00:15:32 UTC
From: Zommbee <devarim@hotmail.com>
Message-ID: <L-GdnUqFBs67JMrYnZ2dnUVZ_tCdnZ2d@comcast.com>
Source record: 49612

Hello all,

I have just acquired a Kenwood TS-440Sat (with auto-tuner). My antenna is
about
150' of 'random wire' (of which 60 feet is in my attic, on the way to the
70+feet that is
'in the air'). I want to work all bands (160 - 10). Should I just turn off
the auto-tuner, or use
it in conjunction with my AT-180, which tunes 160m, as the 440-AT does not)
or
just bypass the AT-440 tuner altogether and just use the manual tuner? In
other words,
tune the AT-180, then let the 440-AT take over? Or just use the AT-180 for
160-meters,
and let the AT-440AT tune the rest of the bands (bypassing the AT-180)?

Thanks,

Dave WB7AWK

Velocity = length/time. Length changes with velocity.
Time changes with velocity. What's wrong with this
picture?

Traps are high-impedance devices at their resonant frequency.
For them to work properly, they need to see a low impedance on
the far side of the trap. If they see a high impedance on the
far side, they cease to be "traps" and become the phase shifting
coils described by Kraus useful in a phased array.

Cecil:

Seconds probably came into existence the first time, the first man/woman noticed that sand falling though a narrow opening could be useful in measuring motion and distance (specifically the rotation of the earth in the heavens--is my guess. But, I do admit earlier devices--suns movement, moons movement, heavens movement, movement of the shadow from a stick, etc.)

But, you already knew that... But, if you are speaking of "Universal Time Frame" seconds--I don't believe anyone claims to have detected them--yet, I wonder about the UTF with no formed opinion.

Now, what argument do you propose for me enjoy thinking about?

Cecil:

Lorentz would ONLY plug time into an equation because he did NOT know and understand the real workings of the ether, and, strangely enough, the "quaint notion" of earth time can be used (a mixture of movement and distance.) In much the same way, 377 ohms (the impedance of ether) stands for a mathematical term which can be accounted for with NO other term(s), but obviously speaks to some unknown quality/law/property of the ether...

But, once again, you already knew that...

Dave

I would recommend not using the TS-440SAT tuner. It is only configured
for a very small range of tuning. The AT-180 is designed for a much
greater range of tuning mismatch.

Again, you prove my contention that you are indeed a moron. If small business cannot afford to pay minimum wage, then I don't want to subsidize them either. They need to find another line of work, or go to work for someone that can afford to pay minimum wage. Yes, things will cost more. BFD, people will make more, and fewer people will choose to sit on their asses and hold their hands out.

Cecil:

I have wondered on some of your thoughts. Let me attempt to kludge together an example to show how so:

For one example, the same amateurs which accept the notion of "eternity" and therefore time--a method to measure it and know-of-it by, without question, will also argue that a box in space contains ABSOLUTELY nothing; yet, they claim time exists and the box which contains nothing is being held subject to times qualities and laws. However, an argument could be made, what sense would time make if it measured nothing, indeed, how could time possibly exist as we think of it (can occur without need for motion and/or distance?) If you were in that box time itself would cease to exist and but obviously we have been there and our notion of time does NOT stop, but then, that only proves movement and distance...

The point being, time CANNOT exist AND a box in space be TRULY/ABSOLUTELY empty. If you believe in time, you already have made an argument for the ether. (However, no "proof" is absolutlely established, as time could exist AND the box can contain ether, which is the crux of it all...)

Imagine the "empty box" out in space, a VERY LONG time ago, and a bunch of minds are around it arguing if it is truly empty or not. Then imagine the big bang theory is not only possible, but it happens right before your eyes in the space contained within the box (empty space), would those minds still be arguing about the ether being impossible, what "clock" would they have timed that bang with?

What say you?

>them either.

you anyway indeeed the entire tax code is built around it the poblems
is the steady small infaltion means the balcances keep geting thrown
out of whack

and what happens is the small bussness simply finds ways of making do
with less labour not go out of bussenss and thus with out some type of
subisdy small bussness which creates most of thejobs reduces
employment negating any benifit to the economy as a whole

> They need to find another line of work, or go to work for
>someone that can afford to pay minimum wage. Yes, things will cost more.
>BFD, people will make more, and fewer people will choose to sit on their
>asses and hold their hands out.

no if not done fewer people end up working at all they get higher pay
and a grater unemployment and MORE people with thier hands out becomes
the case if the mimimun wage is simply increased without adgements to
busness taxation and the rest which is what the President has proposed
in the past and may be able to out through since pelousis will want
some acheivement to point to in the next election cycle

Yes, I'm afraid that's true.

I try to avoid simplified explanations just because people forget that's what they are, and begin treating them like fact. A good example is the recent thread about there being two "theories" of ground plane operation, one being the simplified explanation of operation as an "image". (I still remember an April magazine article in which the author began with the popular and common "image" idea to explain the operation of a grounded vertical. Then he proposed drilling a hole in the ground and putting the vertical there, fed at ground level. This, he said, resulted in the "image" being above the ground. The perfect stealth antenna! Anyone who knows where this appeared -- must have been around the '60s -- would do me a favor by letting me know. I'd love to read it again. I've searched the entire collections of QST and HR to no avail.)

But back to traps. Trap operation is indeed a lot more complicated than most people realize. I was recently contacted by a puzzled EZNEC customer who saw a situation where a trap had very little effect. He had put the traps where the current was normally very low, so of course the traps did little. Plenty of current was being induced in the wire beyond the trap by mutual coupling from the field produced by current on the wire on inside of the trap, whether the trap was there or not.

The simplified idea of a trap as a short circuit on other bands also leads to bad decisions. On any frequency band below its resonant frequency, it acts like a loading inductor; on bands above resonance, like a capacitor. It's common to see more loss on the lower frequency bands where the trap is a loss inductor than at the trap's resonant band.

Modeling makes it easy to find out what works well and what doesn't for
a given application. But of course, you have to know the trap's L, C, and R.

Well, my question is in the context of rf ground being a function of the
antenna subsystem. It wasn't clear why you recommend use of a transmitter
rf ground, if the antenna system doesn't require it. Yes, I would run some
sort of rf ground at the rig if I were using a random wire fed with a tuner
in the shack, because the antenna system requires it.

My own setup is a ground mounted vertical with a modest 10 foot diameter ground system. The "rf ground" is at the base of the antenna (as is a separate lightning ground). The shack is on the second floor, and has only a safety ground at the rig.

Thanks for pointing me in that direction. That program is a goldmine!

Also thanks to everyone else for their advice.

I looked at rfparts.com for suitable capacitors for these traps (assuming I don't go the coax trap route), and I gotta say, they sure are proud of their capacitors ... $16+ for each 5 KV doorknob capacitor.

For a dual-band 80m/40m dipole using resonant traps, how can I figure out the capacitor voltage rating I need for each power level?

This antenna is never going to be used over 200 watts and rarely over 100 watts, in fact it's probably going to spend most of its life around 10 watts or less (FT-817 / IC-703).

Wayne:

I see...

An antenna design requiring a system of underground ground radial(s) to
function correctly (or at least as designed), (or, for that matter,
above ground radial(s) running though bushes) would only be a "complete
antenna" if such were taken for granted had already been installed
(meaning the "rf ground-establishing" radials.)

And, if there were any chance at all I would be running a kw, and
touching both the ground radials and the ground at the same time AND
wanted to cover all special case/weird/worst-possible-cases (and I do
propose everyone should plan on this)... I would provide a nice low
ohmic earth ground for such radials (possibly useful for safety only.)
But then I am a sissy and find rf burns painful.

I didn't realize you were asking me, "If the guy has only installed half
of the antenna, should he install the "other half?" The answer to that
is all too obvious.

Yanno, those trick questions always throw me!

Regards,
JS

2357. Re: HOW do "dual-band"VHF/UHF antennas work?

Newsgroup: rec.radio.amateur.antenna

Dual-band mobile antennas in general have some phasing network that allows the antenna to have a good radiation pattern (gain at the horizon) on both bands.

They also need to have impedance matching on both bands.

Unfortunately, there's nothing universal about dual-band designs as far as continuity or shorts or anything like that. Additionally, a search on "Comet SSB-7" brings up some fairly unfavorable eHam reviews, many of which mention DOA antennas, having to get replacements twice, etc.

There's not much you can do without knowing all the specifics about the design, even then it would be tough to fix whatever's wrong; something you can do is to check are the coax continuity to the NMO mount you're using.

Dan

You guys sure are way beyond me in antenna and trap theory. :-)

I probably neglected to mention earlier, but this antenna is for portable operation in the field on 75 and 40 (none of the other bands are needed), so it needs to be easy to put up and take down and easily transportable, also fairly rugged so things like airwound coils waving in the breexe with ceramic insulators inside the coil probably won't work; instead the coils will probably have to be tightly wound around small lengths of PVC pipe and lacquered in to place.

I need to build several of these antennas (at least 10, I think, perhaps more), and so $16+ each for doorknob capacitors from places like rfparts.com isn't likely to be practical. That reason, along with ease of construction (and now ease of design with programs like Hamcalc around) is why I have been leaning towards coax traps.

The bandwidth (of the traps or of the antenna itself) is not important and so high Q and narrow bandwidth is OK.

Power levels will be low, never more than 200 watts and probably never more than 100 watts, and often around 10 watts.

If you guys say coax traps are a sub-optimal approach I'll take your word for it.

But, the things you all are saying about traps coming with a lot of baggage that no one ever thought of is making me nervous. :-)

It's not exactly a new concept, trap antennas have been used with great success for what, 80+ years now?

If I forget the coax trap idea and go with a resonant coil-and-capacitor approach on, say, a 1.5" coil form (which Hamcalc seems reasonably happy with after warning me that 2" was too big and 1" was too small), what should I look out for?

My Comet antenna went bad too, for grins and giggles I hooked my 2M radio up to my CB antenna . SWR was good I hit all the local repeaters, Have tried it on UHF and it works there too. Probably far from optimum performance but I cant tell a lot of difference between it and the 2m half wave I have used. 1 antenna 3 bands. It works for me. What I think is going on is the bottom hald of the center loaded CB antenna is about the right length for a 1/4 wl 2m antenna with the loading coil acting pretty much like a choke on 2m and 432. On UHF it probably looks lie a 3/4 wl antenna. Losses in the cable probably help the match to the radio. What the heck , it works.

Motors with brushes are "incidental radiators" according to the FCC. I believe PWM or variable frequency drive motors would be considered "unintentional radiators" in that they intentionally generate a radio frequency (9 kHz to 3,000,000MHz) but do not intend to radiate it. (see definitions at http://www.hallikainen.com/FccRules/2007/15/3/).

Incidental radiators must use good engineering practice to minimize interference (see http://www.hallikainen.com/FccRules/2007/15/13/).

Digital devices (I think motor control systems qualify as digital devices) in appliances are exempt from the emission limits for unintentional radiators (see http://www.hallikainen.com/FccRules/2007/15/103/), though the user must cease operation if the FCC finds it is causing interference.

>

When you make your mind up about the MAXIMUM operating power level,
you will be in a better position to finalise the design. Capacitors
are likely to fail if you exceed their voltage at all, not for 90% of
the time, or 10% of the time, but at all, and in microseconds.

If you design a 75/40m trapped antenna, and place the trap resonance away from 40m band (in fact any other operating frequencies), you will reduce the voltage impressed on the trap. At low power levels, you may well be able to use a capacitor or stack rated for around 1000V which will come a lot cheaper and a lot lighter than a doorknob.

But, as Roy has told you, they don't fall into place. The question is whether "hamcalc" will allow you to design with sufficient freedom and rate the operating voltage on the traps. The technique of modelling the proposed design will reveal the voltage expected across the traps, so long as your estimates of the trap parameters are sufficiently accurate.

It might be safer to copy a published design rather than looking for design tools that might not be rock solid.

I cannot offer you a proven design, the thing that I use is pretty low tech, it is an 80m dipole with insulators in the middle of each leg and wander leads to switch between a 40m half wave and 80m half wave.

And Part 15 limits the emissions from Unintentional Radiators, but the
limits are so high as to be of almost no protection to
radiocommunications within a hundred of metres or more of the emission
source.

An ideal RF ground is a point or node where RF current can be imposed
and the result is no change in RF potential (voltage). That is to say
the impedance is zero. All real world implimentations of "RF ground"
are less than perfect as measured by their real world impedance.

The coax trap is a relatively new idea. I don't think it was around until the '70s. They definitely have their place, being cheap, simple, and rugged. And the loss is minimal in a lot of cases. Note, however, that there are two ways of connecting the coax. In one, the center of one end of the coax is left open. In the other, the shield of one end is connected to the center conductor of the other, and the two remaining ends are the external connections to the trap. The latter method gives an L/C ratio that's generally more favorable.

As for the "great success", almost no amateur is able to tell when he's getting a couple of dB loss, which is about what you typically get with an unfortunate trap/band combination. I've mentioned that this is what happens and how I've avoided it, but most people happily accept it, if it happens, without worry. Each to his own.

> If I forget the coax trap idea and go with a resonant coil-and-capacitor
> approach on, say, a 1.5" coil form (which Hamcalc seems reasonably happy
> with after warning me that 2" was too big and 1" was too small), what
> should I look out for?

For your application, I'd probably use coax traps. Using a separate coil and capacitor aren't a guarantee against loss. Even a pretty good trap can introduce a fair amount of loss if it ends up looking like a big inductor in the wrong place in an antenna on a band below the trap's resonant band. Or if you put it in a point where there's an extreme high voltage between the ends on the band where it's resonant. Without the ability to measure trap characteristics and do some modeling, what you end up with will be determined entirely by luck. But as I said, you probably won't notice the difference anyway.

Until it gets to the 1/2WL self-resonant frequency where
it yields the 180 degree phase shift described by Kraus.

Quoting Kraus: "A coil can also act as a 180 degree
phase shifter ... The coil may also be thought of as
a coiled-up 1/2WL element." This coil is placed at a
current minimum point in a phased array.

This does NOT mean that the length of the wire used in
the coil is 1/2 wavelength. It just means the coil is
series resonant with a 180 degree phase shift.

2372. 4:1 Current Balun Common Mode Impedance?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-13 13:30:51 UTC
From: Danny Richardson <n_group@k6mhe.com>
Message-ID: <1msgl25qepu3251jee7slvb2qhndm04lfk@4ax.com>
Source record: 49546

I'm looking for input regarding the common mode (choking) impedance
for 4:1 current baluns. A friend recently purchase a commercial 4:1
current balun and, out of curiosity I set it up and measured the
common mode impedance and was very surprised at the performance I saw.
A very narrow range peaked at about 1.58 MHz. (The unit's rated
frequency range is 1-30 MHz.)

I have no experience with this type of balun having always used 1:1
ratios and I'm wondering if this is typical for this type of balun.

Because one doesn't post binary attachments on this news group I have
placed a schematic and a common mode impedance plot for the balun
along with a reference plot for a commercial 1:1 balun at;
http://k6mhe.com/balun.html

For a rough approximation, you can model the trap as
a stub with the same VF and Z0 as the coil. Equations
(32) and (51) in the following IEEE paper are useful
for that purpose.

If inexpensive traps are the ultimate goal and the coax
is free from the local cable TV company, self-resonant
coaxial traps might be the way to go. How much loss is
in a coaxial trap?

I once bought a commercial 4:1 balun wrapped on a
type 2 powdered iron core rated for "all-HF" operation.
The performance sucked. I had the factory measure the
choking impedance and it did indeed suck. Sorry, I don't
remember the exact results but it was designed by Jerry
Sevick, W2FMI, and described on page 34 of "Building
and Using Baluns and Ununs".

Because of the folding back of the currents I would not expect the 4:1 step up transformer to be a stirling performer at common mode rejection...
The best way to approach this is to use the 4:1 transformer balun strictly as a transformer, then add a 1:1 choke balun in series with it...
Personally I would wind the coax into a solenoidal choke balun immediately below the 4:1 transformer <being thrifty and all that> and call it good...

I like your reasoning, although realistically they'd have to have a
well-publicized program to do so that would most likely have various
"deadlines" that would get pushed back a few times before really having any
meaning (just as the switch to broadcast HDTV has done!) I'd expect that
equpiment manufacturers would -- for a time -- be building dual-band radios.

Given how "abused" FRS and GMRS are anyway, perhaps the FCC could just drop
the GMRS licensing requirement and pretty much be done with it!

Most current thought is that the expansion of the ether might be
caused by the movement of (expansion of the space between) the galaxies.

I had a problem with an recently purchased USED Diamond SG-7500 at a Flea Market.
Was told it was OK, but upon testing on the Vehicle I had very poor VSWR....So much for Flea Market Bargains! !
I tested it with an MFJ Antenna Analyzer which showed it to be "out" but was not sure whether it was the base matching unit, or the phasing elements in the antenna rod.
I emailed Diamond and received a very nice letter with the construction of the antenna and prices for the replacement parts. Did not solve my problem, but "did" lead me down the right path.
I ended up borrowing a friend's SG-7500. Measured the Capacitive & Inductive elements in the Antenna Rod..no difference. Since the base utilizes a capacitor in series AND a coil shunt to ground, it was awkward to evalualuate if the shunt coil or capacitor in the Base Unit was bad. I substituted and base unit on my antenna...voila! Good Match. I ordered up a new coil from Mfr for $35.00 and problem solved.
Substitution is sometimes the best troubleshooting technique. I suspect the original owner put TOO much power into the Base Unit !!

Sure, it is just 6 inches of wire with a crocodile clip on one end and
the other end wrapped+soldered to the wire on one side of the
insulator. The croc clips are either clipped to wire on one side or
other of the insulators to make a 40m half wave or 80m half wave.

The red-shifted background radiation is not
necessarily a Doppler effect.

How are you connecting it to measure the common mode impedance? I don't think you can just connect the input leads together and output leads together like you do with a 1:1, but I haven't taken the time to think much about how you really should measure it. . .

The background radiation might not even be from the Big Bang,
necessarily. But like the doppler red shift, it's the best
scientifically supported explanation at the moment.

Yes, I measured with the leads connected together as you described.
However, after I posted my question this morning I looked around and
found I had an Elecraft BL-1 current balun. This balun can be
connected as a 1:1 or 4:1 by just moving two wires on the circuit
board - no other changes are necessary.

I measured the BL-1 in both configurations, using identical methods
which show close agreement.

You can see the results at: http://k6mhe.com/elecraft.html

Unfortunately, a lot of ham lore also suggests that traps are much
worse than they actually are. The typical proponent of feeding a
"G5RV" with ladderline->balun->tuner rather than dreaming of using
traps probably believes that he has the more efficient system.

IMHO, for the case in question; 80 and 40 M operation with BW not an
issue, I would use coax traps and be done with it.

The major objection to traps in my estimation is the reduced BW that
results from the wire shortening and inductive loading on the lower
bands, not the additional loss. Any of the single feedline multiband
antenna *systems* that I can think of have higher loss than a
single-band resonant dipole. You can have your loss in traps or stubs
or you can have it in the transmission line/balun/tuner. Your choice.

I have placed a couple of files here that might be useful to the OP:

http://k6mhe.com/n7ws/QST_Correspondence_3_84.pdf

http://k6mhe.com/n7ws/QST_Correspondence_8_85.pdf

Also, Owen, I think you said earlier that the coax capacitance isn't a linear function of line length because of transmission line effects.

The referenced authors have demonstrated that because of mutual coupling between the coax conductors and the way the trap is configured the line is actually just a capacitor.

http://www.lowgenius.net/kookway.htm
TEH WAY OF THE K00K
Never learn from your mistakes.
Always practice your mistakes; you may get them right.
Always pick on those smarter and tougher than you.
Always believe that only you know the TRVTH.
Never allow logic or reason get in the way of a good k00k.
When being overwhelmed by logic and reason: k00ksuit!
If you are going to be wrong, do it at the top of your lungs.
When caught in a lie: LIE!
When in doubt: Order the Crab Won Ton
Plagiarism is your friend. Use it.
Whenever contradicted; morph, start calling people names, and make false
accusations. Include the children of your target in your allegations,
even if they don't have any.
(06-Jun-05) When nobody else will listen, post to your own fan group.
(06-Jun-05) Obviously, since you have your own fan group, this must mean

that you have fans. Post prolifically to your fan group - you wouldn't want to disappoint them!
(10-May-2005)Everyone reads usenet. Approval here means approval everywhere.
Post numerous blank posts, or posts containing only a message id.
Post numerous copy&paste web articles from crackerpot websites.
Never forget to call kookologists "k00ks."
If there are several, call them "sockpuppets" too
When all else fails, accuse various and sundry kookologists of e-mailing viruses to you. This is a sure-fire method of garnering sympathy and ensuring that the General Public will always see things your way. An especially effective sub-strategy here is to accuse them of infecting you with the 'Sasser' worm via e-mail.
Quote notorious scientists or writers - it makes it look as if they approve the drivel you are writing!
(9-Jul-05) Anytime your computer is infected with a virus, bogged down by spyware, attacked over your internet connection, or otherwise suffers from preventable problems, government agencies are responsible and are trying to silence you and are monitoring your computer files.
Ignore all traffic signs and feel free to trespass, you don't have to obey any rules.
Scare your enemies with lawsuits, police escorts and whines.
Always back up your empty (albeit noisy) threats with phony LARTs, false police reports, and harassing letters to the FBI and other gubbermint agencies.
Be vigilant in your redundancy. The more you repeat yourself, the more likely others will believe you!
If you can't find anyone as crazy as yourself to support you in the flamewars you start with the normal population, create sock puppets and use anonymous remailers that shamelessly hang on every word you write.
(17-Mar-05) When dealing with law enforcement, remember that it is they who have the problem, not you. Be sure to inform them of this at every available opportunity, as they will surely appreciate your constructive criticism. Be sure to make them aware that YOU KNOW YOUR RIGHTS! ("The cops like that, when people know their rights. That way they don't have to read them to you on the way to the station." - George Carlin)
The more your fake personalities adulate you, the more respect you'll get!
When confronted with a reality that you don't like: Announce loudly that you are departing, never to return as long as there's an Internet. Come back in three or four days and claim you were drunk, hacked, abducted by alience, or forged. Alternately you can just not even mention your prior departure, and if anyone asks you about it, either ignore them or respond with something along the lines of "YOUR NOT THE BOSS OF ME! *PLONK*!" People really know you mean business then.
Always remain clueproof.
(20-Mar-05) Anyone who does not believe that you are the reincarnation of [$DEITY_OR_PROPHET] is obviously an infidel lacking in faith whose soul in in peril of everlasting damnation.
When responding to one line challenges, post paragraphs of rants and

screed in response.
Incoherency is not a roadblock to poasting.
Neither is illiteracy.
Delusions poasted often enough become fact.
Claim you will destroy <insert newsfroup> for attacking you.
When spnaked, send cmsg for Fanboi newsfroup(s).
Find your Lame, Use your Lame, Be your Lame!
Post Edit when the TRVTH hurts.
Always sneck the offending newsfroups.
Always poast pictures of yourself so you can be admired in all your k00ky glory.
Always accuse others of the very acts you are guilty of.
Post lots of boasts about your high IQ and incredible talents.
(20-Mar-05) If you repeat a lie often enough, it becomes the truth.
Anybody who fails to understand this is engaged in a deliberate campaign of misinformation and character assassination.
Always <plonk> somebody just before replying the plonkee!
The k00k considers itself the most intelligent person in any conversation, possibly on the planet. Other people are benighted and ignorant, and have been waiting their whole lives for the k00k to rescue them from intellectual darkness.
Write a self-published book and claim it a success. Bonus points for comparing it to "Mein Kampf" and/or the Bible.
Declare yourself equal to a deity of your choice.
Claim that you've come from other planets.
Claim thousands of past lives.
Frothing complaints carry far more weight when you send them from "legal@" some domain.
Nothing strikes terror into the hearts of your detractors more than telling them that you're archiving their messages for possible use in the future.
Never forget that everyone else posting to Usenet is a paid disinformation agent looking to discredit you.
Usenet is governed by US law. If a poster in Romania killfiles you, he's obviously violating your 1st Amendment rights and can be sued.
Every news admin in the world hangs out in NANAU, and they're just dying to nuke the account of that meanyhead who just called you "fucknozzle". Drop 'em a line - that's what they're there for, after all.
AUK will be closed down. Just you wait and see.
They've nuked hundreds of accounts in the name of free speech and *yours* will be next.
The k00k will, without any trace of irony, lie, manipulate, impersonate, censor, and declare themselves powerful in ways ranging from the ability to have an account shut down to being God Herself, in order to convince people that they are not liars, manipulators, censors, or insane.
Abuse women while telling how many hundreds you've loved. Nevermind that you're one ugly motherfucker and that there were 30,000 femininas that thought you were a scumbag with bad teeth.
Remember that your ko0ky klaims are 'facts', and that 'facts' do not require proof.

Do not neglect to poast your responses to forums that the originator doesn't read. This will make the people in that forum very impressed with how you tear him to shreds without him being able to respond. They like it even better if you are off-topic for that forum.
Keep in mind that lack of evidence supporting your konspiracy theory actually _is_ evidence, of how effective the konspiracy is in hiding.
(06-Oct-05) When spanked, always retreat to the safety of the Ad Hominem.
(04-Aug-2005) When spanked mercilessly for days on end, proving with each poast just what an illiterate and ignorant fool you are, ALWAYS claim ownership of [person(s),froup(s)]. This works on so many levels. It inspires dread in your opponents that they will no longer be able to poast in their home froup and that they will eventually have to pay rent, to name just two.
Any problems with your poasts are the fault of the konspirators, who are trying to stop you from preventing the extinction of humanity.
Konspiracies that are able to subvert whole governments are always unable to silence konspiracy ko0ks.
The entire United States government is willing to spend millions of dollars for the sole purpose of harassing you.
Hollywood is making movies based on your personal life.
Do not consult psychiatrists or other mental health professionals. They are part of the konspiracy, and will sedate you and lock you away and keep you drugged if you tell them the truth.
Numerology and Astrology are respectable sciences and are useful for proving your case.
Everyone is Tim Hill, or David Green, or...
There is a fine line between trolling and kookery. Find that line and cross it repeatedly. When you are killfiled and/or LARTed for net.abuse as a result, claim victory. If you lose multiple accounts, this merely proves that you are indeed a world-class troll, with a black-belt in manipulation.
If you respond to every post someone else makes, they're obsessed. If they respond to less than 1% of your posts, they're even more obsessed.
Publishing people's real names, addresses, and phone numbers when there's no other way for you to come out of a flamewar with any dignity is cool, and proves that you are a master of secret internet information stores, and absolutely not to be fucked with.
Everyone is out to get you. You can put a stop to this by telling everyone that they're out to get you at every available opportunity.
You are the only sane one.
Those that give you a hard time about morally bankrupt things you yourself admit to are just persecutioners of the new inquisition.
Yelling in all caps and cursing at your detractors is debate. Your detractors laughing at you with sarcastic remarks is obvious anger and jealousy.
If doing something results in the loss of your account, legal hassles, or blunt trauma injury, do it again. It always works better the second time.
Asterisks, lots and lots of Asterisks.

Poking holes in kookscreed is stalking, and is a felony.
K00ks LOVE to "connect the dots". They are, of course, dots that only the k00k can see.
"They laughed at Einstein, too!"

dear rich

thank you again for helping, i was just beginning to think it was all related, and yah i hate loops.

was thinking about just rewiring everything but now i sorta want to find out what specifically is the culprit and fix it, seems more like a chinese puzzle i have a alot of wires all neet thou , no rats nest's

one thing that riddles me, you mentioned in the past i've heard others say this about putting stuff on a seperate breaker (or fuse?)

i don't get that so their is a main feed (one) and many breakers off that so how does a plain ol' breaker "isolate' anything if they are all so 'close' and connected to the main feed?

thanks again , i have a lot of work to do :)

Everything real has an affect and produces one or more effect. In the universe you propose, with ONLY time, what do these "look like?"

Oh, that's right, there would be NOTHING to effect! So NO affect, so NO time! DUH! But, a tree DOES make a noise, even if nothing is there to 'enjoy' it... And, other things are effected by the trees affect of falling...

Now if you claim time IS God, perhaps...

Hi Myles,

It is like any parallel circuit. At one point they are all together,
but they all fly off in different directions and different lengths to
reach the various outlets and switches throughout your apartment.

By code, all of your power demand is spread out and BALANCED so that
no one breaker/fuse is carrying the whole load. This means that your
clothes dryere is not on the same circuit as the oven. They each have
their own wires that goes back to the breaker panel, and each has
their own breaker. Likewise, each room's outlets and lights goes on
its own wire back to its own breaker at the breaker panel. Sometimes
it might be two rooms sharing the same path. This is where you get
into trouble by injecting RF from your shack into the light dimmer in
the bath room.

I know you're right. Requiring good operators will kill the service.

Hams just want to be appliance operators these days and they don't want
license exams that will interfere with them getting to those appliances
even though it means being less skilled. I don't see anyone modernizing
like everyone says is happening. They just get their licenses and grab a
microphone. What percentage of hams have a computer connected to a
radio? Probably less than 30%. Hams don't want to modernize. Guess we
just have live with inferior operators on the bands from here on out.
Then again, maybe hams shouldn't be required to be knowledgable or have
skills. Requiring skills and knowledge is too old skool. Everything must
be outcome based these days, even licensing. It ain't like we have to
help out in emergencies or anything. It's Quantity, not quality. We need
more hams even if they aren't skilled.

I don't need to. That's why we have President Bush. Now I should learned
arabic have if I had known Bill Clintoon and the democrats weren't going
to do anything about the terrorists before Bush got in.

That's the problem with democrats, they hate America, so they don't care
if terrorists attack us. Democrats would rather attack the Bible.

"Hello Antenna-Lovers,
How do dual-band antennas work? I bought a COMET
"SSB-7" antenna for my mobile radio. It worked great for a year or more
and then,trouble. I don't know "HOW" to trouble-shoot it.
Where on the antenna can I check for "continuity" or somewhere I can
look to find a "fault" of sorts.
It costs a bit more than a lower gain antenna. How can I trouble-shoot
it ?"

Just go get another one at Radio Shack.

Tnx, 73, Good luck in the contest.

And to think I just thought you were a tiny little piss-ant, I see you're
a whiney ass liberal now too.

Get the government out of the way. Let the market place decide what the wage will be for any job. If someone wants a job with better pay they need to compete for it. That would also imply making an effort to better yourself, so you're better than the person that is also competing for the job.

And if anyone don't work, they don't eat. It's called taking responsibility for yourself. Democrats create victims and nurture the notion that government is the only thing that can take care of you.

Before the Big Bang everything may have existed pretty much as we know it
now. From some other perspective the universe as we know it may exist as it
did at the the instant in time we call the big bang.. In a universe of many
to infinite dimensions it seems there could always be at least one
perspective of the universe that would appear as a single point much as a
perspective of a line could appear as a single point.

All very well, but how do you argue for the velocity of light slowing down? How do you propose we attempt to measure this loss in velocity? I see those equations, and don't see that as any problem with light having a constant velocity.

The velocity factor of empty space is changing. With
seconds getting shorter and space getting longer, light
just cannot travel as far in a second as it once did.

I own a TS-440SAT and an Icom 756Pro ... the older style tuner in the
Kenwood can handle more types of mismatches than the Icom relay system --
that said -- neither stack up well to a full featured "analog" tuner. It
will really depend on what frequencies you will use the most and your
specific antenna situation. I would try each separately in your situation
and then you have your answer -- part of this hobby is learning through
experimentation.

Source record: 49516

You'll need very low loss feedline, something along the lines of LDF4 heliax to take full advantage of it. So, that means working with "N" connectors until just before it goes into the bag phone. Fortunately for you there's s glut of that stuff on ebay from all the upgrades cell phone carriers are doing.

Also, make sure that the phone you're relying on will be served for years to come. Analog service is under review for possible turndown here in the US by 2008 or so.

You might consider backing a couple of spare 12v batteries (or whatever size it requires) to ensure an adequate supply of power.

The whole point of the yagi is a directional antenna, so it will be best suited for stationary applications.

>configured the line is actually just a capacitor.

Hi Wes,

I was referring to the configuration where the coax forms a o/c stub.

I know that there is an alternative configuration that is claimed to
be superior.

Looking at that alternative configuration where the outer of one end
of the coil is connected to the inner of the other end, and the
external terminals of the trap are the remaining ends:

One way of viewing the circuit is that it is an inductor formed by the
outer conductor of the coax connected to a peice of transmission line.
The impedance as transformed by the transmission line appears in
series with the inductor between the trap terminals.

Ignoring the interturn capacitance of the inductor, and using a trap
resonant at 7MHz using Belden 8262 (RG58C/U) as designed by VE6YP the
circuit looks like an inductance of 3.344uH with a reactance of 147.07
ohms. Lets assume a Q of ~200, so assign a series R of 0.7 ohms.

The coil is 0.7+j147.

VE6YP suggests the length of coax required is 1.53m.

Using my line loss calculator to determine the input Z of 1.53m of
8262 with a 0.7+j147 load gives input Z of 830-j3936.

Reducing frequency in search of the impedance maximum, I find it at
6.870MHz with inductance now 0.7+j144.3 around 20k ohms. This
impedance would appear in series with that of the inductor, so the
trap would have a Z somewhere around 20k ohms. (The Z is very
sensitive to the assumed resistance of the coil, and the loss in the
transmission line.)

Is there a flaw in this approach?

I am a little suspicious of an explanation that says the transmission line does not act like a transmission line.

Coincidentally, the input impedance of a 1.53m o/c stub of that line at 6.87MHz is 0.52-j144.3 (or exactly the opposite reactance to the inductor). A 0.7+j144.3 inductor in parallel with a 0.52-j144.3 capacitor yeilds Z of ~17k ohms... not very different to the superior configuration... if my explanation / analysis is valid.

Owen

> You don't like relativity?

I apparently like it a lot better than some
astronomers and astrophysicists. The space
containing the Big Bang expanded a lot more
than it is possible for 3D space to expand.
Therefore, space is not three dimensional.
Latest theories are 10+ dimensions for space.

2447. Terminating a Rhombic

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-14 17:14:09 UTC
From: ricknj10@hotmail.com
Message-ID: <4559f8cc.26623343@news.optonline.net>
Source record: 49521

If you will remember a few weeks ago I posted my story about building a rhombic. Status report - Two legs of it are up, meaning it is now a vee beam ! Although this is only half of a rhombic much more than 1/2 of the work has been done, because the wires are up in three of the four trees, and the feedline is attached and run into the tuner and the tuner is working.

How's it performing, compared to my standard antenna, a 3 ele SteppIR at 40 ft? Not so good. At times it is much, much noisier. Never has the signal strength been stronger on the vee. But wait a minute, it is not supposed to, it is much too short to qualify as a real vee beam. The leg lengths are 192 feet, and on 20 meters should be more like 6 wavelengths long. But it is not supposed to be a vee beam, it is supposed to be the first half of a rhombic. On with the story.

Ok, I need a little advice. For my termination on the rhombic I found the only power, non-inductive resistor I have in my junkbox is a 50 watt globar, 50 ohms. I want to match this to 450 ohms with a 9:1 broadband balun of some sort. I have determined with my modeling program that 450 ohms is an ok termination for my antenna, and will give me 19 db f/b (only a few db worse than other termination values I modeled). So what kind of core do I buy? Ferrite, powered iron? 2 inch diameter? Looks like I can run the exciter barefoot and get by, or put the glowbar in oil and get somewhat greater dissipation? But for now, running with just 100 watts will satisfy me.

As an aside, I have begun reading this newsgroup with Outlook Express. Not my favorite but at least it has the subject and sender filters, which work like a champ. Now I get almost no QRM, although about 75% of the messages are being rejected.

C. J. Clegg wrote:
> Good afternoon...
>
> Anybody know where I can find some formulas or design information for
> designing coax traps for a dipole?

Reg Edwards' COAXTRAP will get you close.

However, in my experience (several antennas since 1985, moslty 80/40 coax-trap dipoles and inverted Vees) with such traps, the formulas are only a guide. Unless you are very very lucky, you'll need to check them with a grid-dip meter. Adjusting resonance isn't easy, either. Be sure to check them with nothing attached.

> Any thoughts or advice?

Here ya go:

1) Use only high quality solid-dielectric coax. RG-58 is better than RG-174. Bigger pipe is better than smaller pipe - I use 2". Be ready to make a few test traps and waste some coax and PVC pipe.

2) Be aware that coax traps are not symmetrical. Which way you connect them in the antenna matters. (I learned this the hard way). I standardized on "center conductor end of trap goes towards center of dipole".

3) Weatherproof with plastic spray or some such. Even so, the traps' useful life is a few years. They're cheap, make a bunch.

4) You will have to test the traps themselves with a dip meter, and the antenna itself with an SWR meter. I've been able to get my antennas right where I want 'em this way, but it takes a bit of patience and keeping good notes. Some Burndy split-bolt connectors help, too.

5) Some folks claim lower losses by using two pieces of coax in parallel. I haven't tried this, because it's even more work than making a single-coax trap.

6) I have seen all sorts of claims for trap losses, but I don't know of any actual tests done to measure the real-world loss when used in an actual antenna. Such a real-world test might consist of building a test dipole that could be quickly lowered, running the legal limit into it for a measured period of time, then measuring the temperature rise.

7) I do know that in side-by-side operations on Field Day, stations using my homemade coaxtrap dipoles consistently equalled or outperformed stations using Carolina Windoms and G5RVs on the same

bands. (Same power level of rigs, etc.)

8) Consider twin-traps. Reg Edwards has a program for them, too.

A TwinTrap uses the coax trap idea applied to parallel line. The trap consists of a bifilar winding of wire on a piece of PVC pipe, with the End of Wire #1 connected to the Start of Wire #2. Start of Wire #1 and End of Wire #2 go to the antenna wires. The formulas say a TwinTrap has more L and less C than a typical coax trap, which may or may not help you. They are certainly easier to adjust!

--

My current antenna is an 80/40 coax-trap inverted V with the center at about 37 feet up and the ends about 12 feet up. Traps are RG-58 on 2" pipe (actual diameter about 2-1/2" IIRC), fed with RG-8X, no balun. Adjusted for minimum (less than 1.2 to 1) SWR at 3570 and 7070 kHz, will work on 20 with a tuner and about 3:1 SWR.

This antenna has been up several years at this QTH and wasn't new when I put it up. Should be replaced next summer. I use it with my homebrew 100 watt CW transceiver (google my callsign under "web" to see the station.)

In each of the past three November CW Sweepstakes, I have made over 420 QSOs per year, and at least 74 of the 80 sections, from here in EPA. Best was 443 QSOs and 77 sections. Never spent more than 19 hours in the contest. One of these days I may go to computer logging.

Good luck!

That length is almost 3 wavelengths at 20m, and should definitely show
gain.

How high is the vee compared to the yagi? Are the wires uniformly high
or do they slope?

What is the angle between the two legs?

Are you feeding it with open wire line? If so, that could be picking up
noise depending on where you route it and your local noise sources.

The vee beam pattern (even at 3 wavelengths) is much narrower than the
yagi, so pointing it is fairly critical. I've used unterminated vee beams
of about that length (150-200 ft), and they were always clearly better
than simple verticals or dipoles in the vee's favored directions, even
on 20m. But I never had a 3 el yagi and vee up at the same time to compare.

No, no magic there John.

I was referring to use of a antenna for field operations, and mostly I
would rig the antenna as a sloper or an inverted V and it was
relatively easy to lower it, albeit inconvenient if weather was
poort... but field operations are not about convenience, now are they!

It is essentially the first half of the rhombic from the Antenna book.

> How high is the vee compared to the yagi? Are the wires uniformly high
> or do they slope?
Vee is at 35 feet at the feed, and 25 ft at the ends (corners when it is a
rhombic).
Yagi is at 40 ft.
>
> What is the angle between the two legs?
52 degrees, equivalent to a 64 degree tilt angle when it is a rhombic
(maybe tomorrow),

Do you not believe in fact, Cecil?

> You can't even prove that you exist. :-)

There's evidence indicating that I do, and none indicating that I don't. So I'm at least a valid theory. What I can't prove is that I don't exist. For a number of reasons.

He replied, "We kept the receipts." -- Bill Hicks

"They thought I was fair game. I was an instrument of purpose to achieve
their desires and not 100 percent real and ALSO that they had me by the
short curlies because I thought that the world revolved around them and
therefore I think that I am fair game and rightly so. If they want to

play dirty, I get to too. It's not a one-way street. I will use the physcial strength that I have over them, my superior 5'7-3/4" height advantage, the boxing moves I paid to learn, the suprise of pussyfooting up to them with their back to me in a public place 18 1/2 years after the fact and thus not only do will they not know that I am but a pica's distance away from them, but that I even exist on earth." -- Chris Tsao is secretly John Wentzky's psychic twin. MID: <1161246083.152300.195760@m73g2000cwd.googlegroups.com>

Looney Maroon nominee for August 2006 Johnny D Wentzky foamed:
"You never asked someone who goes into areas of the internet that are only for adults who has an underage id somehow or another if they are a cop posing as an underage person online?
I guess lots of people just don't watch dateline or read stories much. Why don;t you go to pervertedjustice,com and see what they do. They are awash in their self-proclaimed glory after they lied to membners of the public.
They are awash in their self-proclaimed glory after they posed as an underage person and agreed to do all sorts of sex acts wioth adult males, and they are adults posing as teenager themselves. They make themsleves into liars by falsely impersonating underage persons and by not fuilfilling the words they tell the victims online in their chats. Why don't you read it where they tell these victims of their deceit about how they have been with grown men and such? Why don't you read it where they say, "That would be cool." after someone makes an advance towards an adult who is posing as a teenager? And, where they agree to meet the person, etc.
Lost control, didn't you?
Is that why you feel as if you need to lie so much now? I see where lots of these false impersonation games are not sticking. They feel as if they can lie and then order the victims to get counseling in the gayblade, governmental, pro-choice tax leech counseling centers. They are doing nothing more than usury and fraud in many cases." -- Wentzky almost comes out of the closet as a pedo/ephebophile in MID: <H%%Eg.28916$Uq1.22411@bignews6.bellsouth.net>

President Bush controls the bombs, he doesn't need to know CW. He hears
where the terrorists are and then wipes them out or captures them.

It really pisses the democrats off when he does that. After the new year,
President Bush will have a war on two fronts, terrorists abroad and a
terrorist democrat majority in congress.

Personally Jim, I doubt your existence. I have a theory you are much more likely to be a "brain in a bottle", you are nothing more than a brain in some aliens laboratory and housed within life support equipment, the body you see as yours is only imagined and a very good illusion.

Some of us here are just like you, but I am real (a "control" in the experiment you are involved in.) And, I do understand how all this can be so confusing.

As was pointed out before and mentioned by someone else, if the antenna is mounted so as to be fed by a feed-line running at ground level AND fed at this low point (coax probably best in such close proximity to "ground ground")--and a set of rf grounding radials emanate in all directions from this feed point (but just below ground), BOTH EARTH GROUND and RF GROUND are at or "are very near" exact points.

For most other situations which come to mind, your statement is true.

So we need CW to make sure that things are not dumbed down, but you
support someone in charge so dumb that he never learned CW when he
could have done so in the military?

You accept some no-coder making all the life decisions for SC?

You are confused. Go sit on the floor until you have it figured out.

> . . .

How do you get quantitative data from that method? How many degrees per dB?

A more direct way is to hoist the antenna up, measure the field strength, then replace it with a full size untrapped dipole, measure again, and compare. (Then hoist up the first antenna again and make sure you get the same reading as before.) The best way to measure the field strength is either with a fixed signal source some distance away and a step attenuator at the receiver, or by enlisting the help of a neighboring ham with either a fixed signal at his end or a fixed signal at your end and a step attenuator at his. I've used this latter method to measure a shortened 40 meter dipole. However, it's important to make sure the other station's antenna is polarized the same and that you both have well-decoupled feedlines. You also have to watch out for sky wave interference -- we saw enough in the afternoon on 40 meters to produce a dB or so QSB -- at a distance of one mile! So it might be necessary to average some readings over a short period of time.

Make sure you measure it on all bands of operation. As I've mentioned before, it's common to have higher loss on bands other than the one where the trap is resonant.

Over the years I've gained enough trust in modeling that I believe the model results for trap dipole loss. In fact, I've also gained a very healthy respect for the difficulty in making even simple RF measurements, so I often tend to trust the model results more than measured ones. Of course, the model results depend on accurate trap impedance measurements. But I'm able to make those with reasonable accuracy.

Descartes was in a parade at the University of Poitiers one year. They also had a fine stallion they wanted to show off. The owner of the horse and the parade organizer had a big argument over who would go first until they agreed to put Descartes before the horse.

Faith is a fine thing for religion, not science.

If there are 3 known types of wombats in the world, I'd agree there are three. If a 4th type is discovered, I will change my mind and agree that there are 4 types. I allow the possibility for change.

If I had faith that there were 3 types, I could continue to have that faith.

Faith is not about fact. Faith is about what you "know" without proof.

I think there is, the voltage drop across the coil will be very
similar to that looking into the coax, the the total voltage drop
across the whole trap might be more like double, and the impedance
more like double. I need to develop a more detailed model to get
better accuracy!

More than one k00k has gone on to win multiple awards after winning the GK, and look up "Edmond Wollmann", "Raymond Karczewski", "Richard Bullis", and "Richard M(orton) Scoville" for examples of what it can mean to win them. Usenet is not intrinsically "real life", but if you insist on making it that way, it will only be so for you. Mind you, in a group full of real-lifing stalkers, I suppose it's real for all of you.

All the transformer will do is change the impedence... What it will not
do is correct reactance... So,if the matchbox is simply beyond its
impedence range the unun 'might' help... But if there is uncompensated
reactance <which is almost guaranteed> it will not help with that..

Rick, you haven't told us where you are and what the heading is down
the center of the vee///

I have noise between me and europe - 45 degrees from mid Michigan and
right through the edge of the auroral zone) on my switchable
arrays - this is on 80 meters...
Beaming NW is the quiet direction...
NE is the noisy ...
SE and SW are intermediate except when there are storms in a particular
direction...
A few days ago when there were massive storms over Texas area the SW
array was the noise champ; 30 over blasts with a steady S9 roar... On
a relative basis EU was quiet that night...

The vee is only temporary, since it is really only the first half of my rhombic so I don't really expect much out of it, but couldn't resist hooking it up to the tuner. This enabled me to get the homebrew tuner to resonate.

The vee/rhombic is aimed 47 degrees from central NJ, which puts it on central Europe.

The crankup tower, currently sitting at 40 ft but will go to 72, is at least 100 ft behind and off to the side of the rhombic and has a 3 ele SteppIR.

I'll provide more info later as today I hope to get up the 4th support wire and can then make the vee into a real rhombic. The problem is, I only have a 4 watt terminating resistor so can only use it for receiving or maybe 10 watt qrp for comparisons. Still looking for a 500 watt terminating resistor or a means of coupling to a 50 ohm load.

If there really were *nothing* there, there would
be nothing through which EM waves could propagate.
Therefore, there is something there. *Nothing* is
outside of the universe. Something is inside the
universe. EM waves cannot propagate through nothing
outside of the universe. They only propagate through
something inside the universe.

I can't remember the numbers, but there is a procedure in either the ARRL Handbook, or antenna book for doing this. Basically, you have a short piece of 50 Ohm coax, a short piece of 75 Ohm coax, and then an arbitrary length of 50 Ohm transmission line.

If the antenna is 75 Ohms, your SWR on the 50 Ohm line should be no more than 1.5:1. Are you sure you don't need a 4:1 balun? If your SWR is around 3 or 4, I would try the balun; easy neough to make out of a 1/2 wave piece of coax.

You are thinking of a nonsynchronous balun described here:

http://www.k1ttt.net/technote/matching.html#k1xx

HOWEVER, this only works for one band (i.e. a monobander...not a
log-periodic covering multiple bands). If the antenna is 75 ohms, why
not simply use 75 ohm coax to the shack and then a tuner to convert to
50 ohms? Seems much simpler and you can normally get free 75 ohm
hardline for the asking at your local cable company (i.e. reel ends).

Kanthal Globar makes 1000 watt non-inductive resistors in the range of 1 to
600 ohms. I used to have a couple of low resistance units that I used to
test audio amps. I believe they were made by Carborundum, same company
different name.

Kanthal Globar has what you need.. You could build a lossy tranmission line
out of nichrome. 20 or 30 db of attenuation and you wouldnt even need a
teriminating resistor.

> where to start.
>

You have not stated which LP you are using. So, my comments are general in nature.

The feedpoint impedance of a LP does vary as a function of frequency and the log characteristics of the elements, their spacing, and the boom geometry. The feedpoint impedance will cycle between a low to high value and generally remain below 1.7:1.

Example: my HF LP [Tennadyne T8] can have any feedpoint impedance between 29.4 and 85 ohms as I tune from 13.5 MHz to 30 MHz and it will have numerous excursions within the frequency range. That is the Physics of LP design.

Since the feedpoint impedance is a variable it is not easily matched to a standard coax line.

Now, a VSWR of 1.7:1 relates to approximately 93% of the rigs power being coupled to the antenna.

To your comment. What is the 6 meter VSWR?

If it is less than 2:1 [90% coupling to the antenna] then forget it!

Actually a lot lot of the side effects are accounted for by there being even
more dimensions, If there may be 10 why not 11 0r 12 or a n infinite number
of dimensions. An infinite number of dimensions would imply that any point
in the universe could be adjacent to any other point in the universe

1/4WL of RG62 followed by 1/4WL of RG59 will give a good
match from 75 ohms to 50 ohms.

Im using a double boom LPA, 50 coax connected to the front with shield
to one boom and
cc to the other. The back of the boom is shorted with a bar, it is a
monoband 50-54mhz
5 element. Swr nowhere near 2:1 (i wish) and i have checked the line
so its ok so maybe
i should have ask how do you adjust the impeadance on a double boom lpa?

The point of a Log Periodic is you are not expected to tune it. The
tune is built into the design as long as it is up high enough (and
probably even if it isn't).

If you SWR is so wildly off, you have a wild problem (feedline is
undecoupled is my guess).

OK, It's a monoband LP.

I am assuming that the inter-element crossover connections are correct.

The feedpoint impedance is determined primarily by the dimensions and spacing of the boom elements. They make a two element open wire transmission line. This is fixed by the design and is not readily tunable [adjustable]. However, secondary tuning adjustments are possible.

The "shorted with a bar" is a tuning stub that provides some degree of adjustment. As stated in another post you may have a 200 ohm or possibly 300 ohm feedpoint impedance [VSWR >4:1]. Please tell us what VSWR value you are seeing. A VSWR of 4:1 indicates a 200 ohms design; 6:1 indicates a 300 ohm design, etc.

Check the dimensions of the tuning stub for length as described by the manufacturer.

A LP is a balanced driven array. It should NOT be fed directly with coax [as you describe]. Direct feed causes a current imbalance and currents on the outside braid of the coax. You need either a choke balun or a ferrite based 6 meter balun.

Hi all,

I am transmitting in channel 3 of 802.11b, centered at 2.422Ghz.
Details aside, let me just say that it is very important for my
application that I sharpen up the spectral mask beyond that of the
802.11b standard. To be specific I need to purchase a bandpass filter
such that I get attenation of greater than 60dB at +- 15Mhz from the
center, i..e outside of [2.407Ghz, 2.437Ghz]. I am looking for
suggestions on where to purchase such filter(s) with the usual
parameters in mind, cost, lead time, etc.

I did see the filters that hyperlink sells, but it would take many of
their 8 pole filters in series to get what I need and they additionally
don't sell filters for one of the channels i would need. Maybe I need
to go custom on this? Any suggestions are greatly appreciated.
Thanks,

Kevin

Don't know about the Comet mobile antenna but I've been using the Diamond series since they came out. The one on my car (4-Runner) has hit so many trees and been straightened so many times it's beginning to look strange. It's also worn to the point where it no longer seats well at the fold over point. (I had to use some lapping compound on it about two years ago to keep it from rattling). It looks like I'm going to need to redo it at the fold over point again.

I have used the Comet duo band base station antennas with good luck except for the one that took a direct lightning strike. Part of the inside disappeared, the top two feet of fiberglass looked like an exploded cigar, and the matching network at the base was shorted. The base station antennas are well built and I'd have though the mobiles would be the same, but apparently not.

Actually I have two Comets and one Diamond base station antennas for 144 and 440. I also have stacked pair of 11L on 440 and 12L on 144 at 130 feet. The Diamond is at 50 feet and one Comet is at 15 feet which is the one I normally use for repeater work. The second Comet is going to be mounted inverted under the Diamond and used for packet/jnos.
>
As to servicing the duo-band mobiles, there's not much to do. The problem could be in the mount, but most likely it's either in the molded base, or in the phasing sections. Most of these use something that looks like a plastic insert between sections. Inside that insert will be either a coil or a folded piece of wire that looks a lot like a paper clip. These serve different functions on 144 and 220. Still they either work or don't. Typically about the only thing that can go wrong is a connection or solder joint. *Sometimes* they get some corrosion down where the antenna fits into the base section. It is held with one or two Allen set screws. Road salt can wreak havoc in these areas.

Hi, I'm looking for a Collins 30L-1 Round Emblem, High Frequency, Linear Amplifer. Not looking for any junk, actually I want one in excellent condition, Must be Round Emblem... Prefer one that has already been refurbished, things such as power supply, caps , etc...So as I do not have to do it...Although I've restored a few of them...I just want one in Excellent to Mint Condition...
If anyone out there has one of these amps, please feel free to e-mail me and if you like call 718-331-7427

Thanks a Lot
Carl

You don't need to go custom. You need to understand the impossibility of
what you are asking for.

Hm, I'll have to think about that one a bit. I checked out the Elecraft info and it appears that the balun is wound on a single binocular core, not two separate cores. You could make a 4:1 current balun that way if you could manage to keep the flux from one pair of windings from coupling to the other, but I don't know right off how you'd do it. I suspect that some sort of complex winding scheme might make it work. But if the one you're trying to measure really has two separate cores, I suspect that measuring the Elecraft might not be a good test of the method.

Don't know. However, the folks at Elecraft have a good reputation for
excellent designs so I banked on that.

Going back the original balun I used (which uses separate cores), you
where concerned about tying the leads together for measurements. I,
for the sake of me, can't see why this would be wrong. After all, we
are talking common mode impedance here and the unit did show excellent
choking impedance at its resonate frequency (about 1.58MHz.). But had
a very narrow range. (dropping from over 6K @ 1.58 MHz. to less than
1K @ 3.5 MHz., 700-ohms @ 7 MHz, less than 300-ohms @ 14 MHZ and the
lowest was 130-ohms @ 30 MHz.

To me, that seemed to be lousy performance for a balun advertized
range of 1-30 MHZ.

Sorry I mispoke earlier. Let me restate this. Hyperlink has an 8pole
filter for several of the 802.11b channels that has the mask -3db at +-
10Mhz, -5db at +-15Mhz, -20dB +- 20Mhz.

Essentially I want to keep 2.417 to 2.437 Ghz, so one of their filters
centered at 802.11b, channel 4 would be ideal, except that they only
sell centered at the standard channels (channel 3 and 6 are the
closest), so in short I was wondering if anyone knows of a vendor that
sells such a filter centered at 2.427Ghz. Thanks for any suggestions.

That looks like you'd have to call them for a custom version which will
probably be lots of $$. Or roll your own which requires a lot of
RF/microwave knowledge. Or hire a consultant :-)

Problem is, if you are most likely the only one needing this there won't
be an existing market and chances that any other company has the right
product could be close to zilch.

Is the inductive side of resonance of no use in
that type of balun?

Hi Roy,

I have read your comment about the requirement for two cores for many years, and I am still puzzled. In the ideal case the balun action is performed by transmission line transformers, and the flux induced in the core by the differential current is minimal. The core primarily affects frequency response and common mode choking action.

According to his books, Jerry Sevick has designed, analyzed, built, and measured many single core 4:1 current baluns. He never mentions the problem you allude to.

What is happening here?

73,
Gene

I wasn't talking about that particular balun just that
particular method of construction. If a balun like that
one were made resonant at, say 7 MHz, would it still be
useful at 4 MHz? at 2 MHz? In other words, what is the
shape of the choking curve below resonance for that
particular method of construction?

> braid of the coax. You need either a choke balun or a ferrite based 6 meter balun.
No balun is needed however there maybe something strange going on so I
will try a coax
balun and try a fiberglass mounting pole, bottom line is i moved this
LPA about 30 foot, changed the polarity from vert to hor, same type of
feedline was used but instead of 70' its 35'long otherwize everythiong
stayed the same.

Actually if the coax is fed through one half of the boom with the outer
conductor attached to that side and the center conductor connected to
the other half of the boom you don't need a balun.

I'm not sure myself, Gene. I've wound single core 4:1's, I've bought at
least 2 of them. I've also been told variously they don't work, and
can't even be made.

Just what IS happening here?

It quickly becomes really ugly. Simply the number of strings is witness
to that:

Bosonic-26
I-10
IIA -10
IIB-10
HO-10
HE-10

If we wait long enough, there will be more string theories than
dimensions they predict.

> frequency response and common mode choking action.

It's true that the flux induced by the differential current is minimal in a transmission line transformer. If, in fact, the balun is wound with coax as I usually make them, the flux induced by the differential current is zero because the differential field is entirely inside the shield.

And it's true that the core affects common mode choking action. The common mode choking action is exactly what the function of a balun is -- that's how it effects equal and opposite (purely differential mode) currents on the two transmission line conductors. In other words, that's how it produces balance and prevents feedline radiation.

So the flux from the common mode component of the current is the very thing we need to look at when we evaluate baluns.

> According to his books, Jerry Sevick has designed, analyzed, built, and
> measured many single core 4:1 current baluns. He never mentions the
> problem you allude to.

I don't know which edition you have. I have only the first and second; I believe there was a third. In the first edition, it was clear that Sevick didn't understand the purpose of baluns or how they accomplished it. So I discount anything he wrote about baluns in the first edition. But he figured it out some time between the first and second editions, so there's some credible information in the second. A number of the 4:1 baluns he shows are indeed wound on a single core. And he dutifully reports their frequency responses when terminated in a correct impedance load (seldom the case in a real antenna application). But nowhere do I see any measurement of their ability to do the primary job of a balun: to balance the feedline currents. So there's no way of knowing whether any or all of the many "current" baluns he constructed actually perform the function of a current balun.

A way to qualitatively check to see if a balun is really acting like a current balun is to connect a load across the output. Short one terminal of the output to the "ground" terminal of the input, and measure the

impedance looking in. Then disconnect that short and short the other output terminal to the "ground" terminal of the input and measure it again. You can do this with an antenna analyzer or impedance bridge. A perfect current balun will show the same, correct impedance in both tests. A perfect voltage balun will show very different impedances. There should be a way to get a quantitative measure of the longitudinal (common mode) impedance from this test, but I don't have time to dig it out just now.

I'd like to add that not long ago I encountered a claim of a 4:1 current balun on a single core. It was indeed -- it was a conventional, as opposed to a transmission line, transformer, although it was wound in a way that made it resemble a transmission line transformer. And it had a fairly decent bandwidth, although a transmission line transformer is inherently much broader and doesn't couple differential flux into the core. So a 4:1 current balun can be constructed on a single core. But I don't know how a 4:1 transmission line current balun can.

> What is happening here?

A whole lot of things could be happening. If an antenna is perfectly symmetrical, a voltage balun will do the same job as a current balun. For an explanation why, see http://eznec.com/Amateur/Articles/Baluns.pdf. So a lot of the "current baluns" might well be voltage baluns. I seldom see anyone actually test the current balancing properties of baluns, and without this, there's no telling what's been constructed.

I haven't looked carefully at Sevick's single core 4:1 "Guanella" baluns. They might be voltage baluns, or they might be conventional transformers -- bifilar windings don't automatically create a transmission line transformer. I don't see any test he ran to verify that they're functioning as current transformers or for that matter as transmission line transformers. In a transmission line transformer, the differential current always has a transmission line path to follow. Some connections can split the wires carrying a differential current apart, in which case you no longer have a transmission line transformer.

If you know of a topology which produces a transmission line 4:1 current balun, I'd be very interested. You could use the same simple analysis method used in the balun article to show that it really is what you think.

Mike Coslo wrote:

>
> Just what IS happening here?

You probably made 4:1 voltage baluns, which worked well enough in your applications. Where a voltage balun is really a bad idea is when your

antenna system isn't symmetrical. In an effort to balance the voltages on the two output terminals, it creates unbalanced currents. The difference between them becomes a common mode feedline current. This is also explained in the balun article.

. . . Here Uncle Remus paused, and drew a two-pound yam out of the ashes.

"Did the fox eat the rabbit?" asked the little boy to whom the story had been told.

"Dat's all de fur de tale goes," replied the old man. "He mout, an den agin he moutent. Some say Judge B'ar come 'long en loosed 'im - some say he didn't. I hear Miss Sally callin'. You better run 'long."

2551. Digital oscilloscopes for FM waveform capture?

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-17 16:50:48 UTC
From: MRW <mr.whatever@gmail.com>
Message-ID: <1163782248.307445.141670@h54g2000cwb.googlegroups.com>
Source record: 49475

There was an oscilloscope article written by Steven B. Warntjes about sustained sample rate in digital oscilloscopes. I wanted to get a verification from the experienced users on this group. Let's say I have an oscilloscope with 25000 sample memory depth and a real time sampling of 1 gigaSamples / sec with 200 MHz bandwidth (-3dB).

If I had an FM carrier at 100 MHz with a 1000 Hz (1 mS period) test signal modulating it, does that mean that a digital oscilloscope with the specs above will not be able to capture the waveform properly?

I was thinking that if the capture window (in seconds unit) is equal to the memory depth (in samples unit) divided by the sample rate (in samples / sec unit), then the maximum capture window that I can use and still maintain the rated sampling rate would be 25 uS (micro-seconds).

So that means that if my carrier signal is deviating between 100MHz +/- 1kHz, then my capture window would at least have to be 1ms/div to capture the deviation properly (?). With a capture window of 1ms/div, my sample rate would decrease to 25 mega-samples/sec, which is not enough to sample the 100MHz carrier frequency.

Is that right?

I know that I can just use a spectrum analyzer, but I wanted to capture the waveform and duplicate the time-domain plot of frequency modulation (amplitude vs. time) that I've seen in the books.

Thanks!

Hi Roy,

Sorry about making such a mess. That tar is really hard to clean up.

FYI, I was referring mostly to Sevick's 4th edition of Transmission Line Transformers, published in 2001. As you mention, he has undergone a considerable transformation (pun intended) since his earliest books.

Sevick does indeed recommend a two-core approach for a 4:1 Guanella balun if the load side is not balanced. As you know, he generally avoids the use of the terms "current balun" and "voltage balun".

My question still holds, however. In a typical situation the "balanced" side, generally the antenna, is only partially unbalanced, not simply shorted to ground on one side. In this generic case would you expect the single core Guanella balun to perform poorly with slight or modest imbalance?

If both sides of the transformer are completely unbalanced it is not clear why one would expect a balun of any type to be useful. What is needed in that case is impedance transformation, not balancing.

73,
Gene
W4SZ

OK, to begin with, why did you post this in an "antennas" group?

Your analysis seems about right, though you left out one important thing: you will be very hard pressed to see the difference between 100.000000MHz and 100.010000MHz on a scope waveform directly. Note that that's 10kHz difference: a normal signal on the FM broadcast band has nominally 75kHz deviation on signal peaks, even if the modulating audio is a 1kHz sinewave.

If you really want to see the effects of FM on a scope display, I have a couple ways to suggest that you can reasonably do it. First, if you want to see the "textbook" waveform, use a much lower carrier frequency. Use a 50kHz carrier, and modulate it with a +/- 5kHz deviation. That's a +/- 10% change in frequency, and it will be relatively easy to see on your 'scope. But even at that, if the modulating frequency is 1kHz, you'll need 50 cycles of carrier to see one cycle of the modulation; so if you want to see the effect clearly,

pick a higher modulation frequency, say 5kHz. Then just ten cycles of carrier represent a full cycle of the modulation. You can grok all that in one snapshot of the display. In other words, instead of looking for a scope that will work on an unrealistic signal, use a signal that's realistic to display what you want. If you trigger the scope on the modulating signal, you don't need a fancy digital scope; an analog one will do just fine.

The second alternative: If you want to see the effect on a 100MHz FM broadcast signal, use trigger delay. If you display the signal at 100nsec/division (normal 10 division wide screen), that's one cycle per division. If you use a trigger delay of 10usec, then a 100kHz shift in frequency will shift the displayed signal by one full cycle. That is, 10usec of 100.000MHz is exactly 1000 cycles, and 10usec of 100.100MHz is exactly 1001 cycles. You will see the frequency deviation from 100MHz as a phase shift in the displayed section of the waveform, 1/100th of a horizontal division per kHz of deviation. You can use a relatively cheap analog scope to do that; the main requirement is a stable trigger delay. Also, you can look instead at the 10.7MHz IF frequency commonly used in FM broadcast receivers, and that makes the job even easier. It's actually not a bad way to check the deviation of a broadcast signal, at least in a gross way.

Cheers,
Tom

I'm glad to hear that. The first edition sold a lot of copies and contained a lot of misinformation. The second was better, and hopefully undid a little of the damage the first did. Maybe the net result was neutral by the time the fourth was published.

> Sevick does indeed recommend a two-core approach for a 4:1 Guanella

That's one of those improvements over the first and second editions.

> As you know, he generally avoids
> the use of the terms "current balun" and "voltage balun".

Yes, I think that's mostly because they're the terms I coined and used.

> imbalance?

I'm sorrry, I don't know, because I haven't looked carefully at his "Guanella" balun to see if it's a current balun, voltage balun, or something in between. As I pointed out in my balun article many years ago, if an antenna is perfectly symmetrical, voltage and current baluns perform equally. If it isn't, the voltage balun can make things even worse.

> If both sides of the transformer are completely unbalanced it is not
> clear why one would expect a balun of any type to be useful. What is

Have you read the article at http://eznec.com/Amateur/Articles/Baluns.pdf? If you have but still think that, then I certainly failed to communicate.

For the benefit of readers who have read the article, I didn't mention a second source of imbalance: mutual coupling to the antenna. This can occur if the feedline isn't run completely symmetrically relative to the

antenna. And, interestingly, there are situations where this is occurring that inserting a balun can actually increase the common mode current. That's a story for another article some day. But first I've got to somehow get people to read the first one.

If you have 1 ms period repetitive modulation, the repetitive waveform you're generating repeats only once every ms, or more if the carrier and modulation aren't synchronized. So it takes at least 1 ms to capture one full cycle of your waveform. At 1 Gsample/sec, your sampling interval is 1 ns; 25,000 samples takes 25 us, way short of the 1 ms you need to capture even one cycle of the waveform. Yet you need a sampling period of 1/400 MHz = 2.5 ns to even hit the Nyquist rate, and around the 1 ns sample period to get a practical reproduction of the waveform.

So yeah, you can't do it with that machine.

Since I began using Outlook Express as my newsreader I have been able to implement subject line filters which are nearly perfect in eliminating the QRM. Every few days I add to this filter as needed.
If you use Outlook Express and are not familiar with filters you are missing out on a real useful feature.
All you have to do is hit tools/message rules/News. Then build a new filter "where the subject line contains words" and then put in the words that will be used to eliminate the QRM. Works as good as a Wouff Hong. Here's my current list:

contains 'cw-forever' or 'slow code' or 'democrat' or 'Fcc took' or 'rumsfeld' or 'cw' or 'poll' or 'dumber' or 'blog' or 'crapthon' or 'crapathon' or 'cattle' or '...' or 'flonking' or 'punce' or 'passed tech'

I should have said "Works ALMOST as well as a Wouff Hong."
Because a real Wouff Hong, properly administered, would eliminate not only the QRM but the QRM'er - a beautiful thing.

Hi Roy,

Yes, I have a copy of your article, and I have actually read it. I think I even understand it. I took a fresh look just before I made my first post in this thread. The schematic for Sevick's Guanella 4:1 balun is exactly the same as your figure A3-4.

The only question I have is regarding the issue of two cores vs. one core. I have no doubt that grounding one of the high impedance leads can lead to improper choking action with a single core. In the completely balanced case the single core should work perfectly. So what happens in a more typical case where the antenna is in an unbalanced environment, but not fully shorted to ground on one side?

There are a number of designs out there for single core 4:1 "current baluns", all essentially the same, including the Elecraft balun. I have not tried to perform any measurements, so I have no idea whether these designs typically work or typically fail. That was the foundation of my original comment and question.

Then I'm puzzled by your statement that if an antenna is completely symmetrical, no balun is necessary. The very first two figures in the article and accompanying text show this isn't true. Of course, if you have a symmetrical antenna AND the feedline is placed symmetrically AND you have a truly balanced tuner, then there will be no common mode current and a balun won't do anything. Maybe that's what you meant.

> The only question I have is regarding the issue of two cores vs. one

It's absolutely true that the test I proposed is a worst case, much more severe than any realistic application. But I'm sorry, I don't believe there is a "typical" case -- there are much too many variables involved. In many situations, a balun isn't used at all and the result is entirely satisfactory. Others take rather heroic effort to keep the common mode current tolerable.

> There are a number of designs out there for single core 4:1 "current

Sorry, I've never seen or measured one. It would be great if someone would run some balance tests and see how effective it is.

By the way, there seems to be a pervasive myth that a 4:1 balun or transformer used in an antenna system actually effects a 4:1 impedance transformation. You can make one look wonderful by terminating it with the design impedance (typically 200 ohms resistive) and looking into the input. But anyone wanting to have a real eye-opening experience should measure the impedance of a multi-band antenna on several bands, then look at the impedance at the input of that "4:1" transformer when terminated with the actual impedance it sees. That's not to say the transformer doesn't do something, or even that it might present an

impedance that's more (or less) favorable for a tuner to match. But you'll find that the transformation ratio is often not only far from 4:1, but the transformer also introduces considerable reactance. Whether this helps or hurts when it comes to matching is something of a crap shoot.

I don't really understand what drives this bunch of posters to cross post to this and other inappropriate groups. It's apparently some kind of attention-getting need, like a two year old tugging on your arm. Reasoning with them in a polite adult way does have about as much effect as with a two year old, so there is some similarity. If those guys are really amateurs, their banal postings provide a good reason for any potential new amateur to avoid amateur radio -- maybe that's their objective. But in order to keep up the annoying din, they change "handles" and subject titles almost by the minute. ("Mom!" "Hey, Mother!" "Muh-thur!" "Mommy!" "Moooom!") This makes filtering just about as time-consuming a process as just constantly marking the threads as read as they appear.

I use Thunderbird, which also has filtering capability. But what I'd *really* like is the ability to filter on the basis of the newsgroups to which a message is cross-posted. Anything with "policy" or "CB" would be the first on the list. As open-source code, people are able to and have created quite a number of Thunderbird add-ins for various jobs. It would be really cool if someone with a bit of spare time would put together one to do this kind of filtering. My gut feel is that this wouldn't require much more than a minor modification of the existing filtering routine, but I haven't really looked into it.

In the meantime, I just consider the annoying background din as something that comes with the territory, like mosquitoes in the woods or lice in cheap hotels. Some effective repellent would be nice, though.

Not really a problem for me. With my news reader, its so easy to add a
new filter... it essentially takes less time than reading one or two
additional post from the idiots, so is well worth the effort.

Get used to the QRM, because after CW is eliminated you're going to wish
your rig did come with Rettysnitch and wouff hong filters...

But I forget, due to the lack of support for good tests a lot of you
people must like hearing Lids.

Two basic issues, Roy. The first one is that these individuals are not considering that there is a human behind the others they are playing their little game with - it's just a big text based interactive game. The second issue is more serious I'm afraid. We can figure out that one from the content of their posts.

Roy,

If I said that no balun is necessary then I apologize. I certainly did not intend to say or imply such a thing. I do believe, however that a single core balun would serve well if the antenna is balanced by design and by its environment.

The question is how the single core balun performance degrades as the antenna becomes less balanced through, for example, an asymmetrically placed feedline. It seems difficult to analyze that problem, and experimentation would be required.

I agree completely that there's no good way to analyze what will happen. While you can model a 1:1 current balun with EZNEC or other NEC-based programs, and an ideal transformer with NEC (or simply multiply reported impedances with EZNEC), combining them for a model of a transforming current balun, there's no way I know of to model even an ideal voltage balun. And as I mentioned earlier, a real transformer is far, far from ideal when terminated with the kinds of impedances you see in a real antenna, particularly a multiband one.

You would indeed have to experiment. But it's easy to make quantitative measurements of common mode current as I showed in the balun article. So you can make good comparisons of one method over another for your particular setup. I'd certainly be cautious of trying to extrapolate what you found to other situations, though.

2571. Operation of bootstrap coax traps

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-18 03:58:04 UTC
From: Owen Duffy <owen@no.where>
Message-ID: <fmvsl259t1j6omumquggugs3rg2073bp6o@4ax.com>
Source record: 49345

Picking up on a comment in a previous thread on coax traps

The type of trap I am discussing here is one where a coil is formed of a length of coax, the outer conductor of one coax end is tied to the inner conductor of the other coax end, and the remaining connections (outer at one end and inner at the other) form the terminals for the trap.

I have drawn a diagram of the configuration at http://www.vk1od.net/lost/coil.gif .

I am unsure of who originated this design, so until I determine that reliably, I will refer to the design as the "bootstrap" type, as the inductor is connected in parallel with one end of the transmission line, and the outer of the other end of the line is connected to the end of the inductor so as to bootstrap the pair.

I have seen explanations of the operation of this circuit, and those that I have seen seem unsound.

Let me propose an explanation of how this trap works.

With reference to the diagram, I1 is the current into terminal A and the inner conductor of the coax. Lets designate V1 as the voltage beween the inner and outer of the coax at that point.

I2 is the current out of the other end of the coax inner conductor, and lets designate V2 as the voltage beween the inner and outer of the coax at that point.

The outer conductor of the coax forms a coil with and equivalent inductance and series resistance.

The current that flows on the outside of the coax outer conductor is I1+I2.

V1, I1, V2, and I2 have a relationship given by the common transmission line equations, given gamma (the complex propagation constant) for the transmission line, and its length.

The impedance between terminals A and B is given by (V1+V2)/I1.

The values for V1, V2, and I1 can be found by solving the set of simultaneous equations that describe the system.

It seems to me that an explanation that considers that I1=I2, or that propagation time on the coax is zero, or that the inner conductor forms a inductance with mutual coupling to the outside of the outer

conductor is flawed.

Owen

Not sure how you measured it, but you do realize that the bslun needs to be terminated in it's appropriate imepdances (load) for you to measure it's response over frequency. Without the loads, the capacitive portion will dominate due to the winding cap and it will peak at a very low frequency. With terminations, the response will broaden out (remember? s^2+R/Ls+ 1/LCwhere R/L = wo/Q).

Yes, an attention-getting need. It could be an extension of something I learned as a little kid: If the kids grabbed one kid's hat, objecting just prolonged the game. The hat would be tossed around as long as the hatless one kept chasing it.

The trolls' NG behavior seems like a modern-day hat grab. If you want them to lose interest, stop chasing the hat.

Oy Vey, my head hurts after reading all this, and it is spinning, spinning, and the blood in my veins is transforming into chili... Maybe that is why I have converted my balanced antennas to 600 ohm feed and built my own link coupled, balanced tuners... Because chillun' if youse look at the so called balanced tuners everyone is peddling these days, dey haint... <hey, I read Huck Finn when I was a kid, also>

So, let us summarize...
I suspect that most will agree that using a B A L U N to coaxial feed an unbalanced load, such as a Zepp, or a ground mounted vertical, is not a good idea...
I suspect that most will agree that that using a B A L U N to coaxial feed a mostly balanced load, i.e. dipoles, inverted vees, yagi-uda's, etc. can be a good idea - depending...
Where I suspect the water gets muddy is when we carelessly <intellectually speaking> mix the functions of a choke balun with an impedence transformer...

As Roy has pointed out, having both magnetic activities on the same core will allow mixing of the core flux and possibly <probably even> degrade the functioning of one or both... Notice that Sevik has designs that use two or more cores to separate the functions of transforming impedence and of choking common mode current.. And that he has no hesitation in series connecting two or more devices to get to the final result desired...

Probably, the cleanest way to doing both a transformation of impedence and of balance is to use one or more UNUN's in series to reach the desired impedence, and then series a 1:1 BALUN designed for that impedence level... If you still lie awake at night worrying about current on your feedline, the add a solenoid wound, coaxial choke below the whole mess...
Or go back to wire feed...

On a double boom LPA ithe nominal value can be around 50 ohms, It depends on the spacing of the booms. Bill Orr has a design for 6 meters that used 3 or 4 elements in an LPA and then added a few parasitic elements. I tried this antenna and mine had no noticeable improvement over my 4 element Yagi

Jimmie, I would expect no improvement in GAIN over a four element Yagi.

But how does the VSWR compare between the two antennas when measured continuously from 50.0 to 54.0 MHz? I expect the LP will have a more uniform VSWR. That is why people choose LPs. Namely to get a 'flatter' VSWR response.

I want to mount a 2 meter rig on my Honda Foreman ATV. I want a high-gain antenna, either a 5/8 wave or possibly a collinear. I would like to stay around 4 to 5 feet in length, but it is possible that a collinear would be longer.

Any recommendations on this ? I know that an atv would not provide much of a ground plane, so I think a 1/4 wave would be out of the question.

Any recommended "type" (wavelength, etc) and brand for this use ?

Thanks for any comments !!

a lot of the performance probably depends on the frequency vs length of the coax. if the frequency is low enough that the delay in the coax is small then you basically have a capacitor (the inner conductor to the inside of the shield), in parallel with an inductor (the outside of the shield). it gets a bit uglier because of capacitance between turns on the outside, but that is likely much smaller than the internal capacitance. so you end up with a basic parallel resonant circuit. at high frequencies where the length of coax is longer than a small fraction of a wavelength that probably falls apart and would take much more complex analysis to figure out.

It appears to me that the two currents are designed
to create a transmission line stub in the middle of
an antenna wire. What if I2 is equal in magnitude
to I1 and phase-shifted by 180 degrees? Wouldn't
that cause all the current to flow *inside* the coax
thus eliminating common-mode currents at the trap?
If common-mode currents are eliminated at 'A', wouldn't
that also eliminate common-mode currents at 'B'?

Even the MFJ balanced tuners feed the common-mode
currents directly through the tuning caps where
they encounter a 1:1 choke-balun on the input of
the network. That's not much difference from using
an unbalanced tuner with the choke on the output.
Your link coupling is a better solution although
a fixed number of turns in the link probably won't
work 3-30 MHz.

For optimum performance, a 5/8WL needs a better ground
plane than a 1/4WL. I once provided four radial whips
attached to the luggage rack on my motorcycle which
worked with a 1/4WL vertical. It performed well.

> Any recommended "type" (wavelength, etc) and brand for this use ?

On my bicycle, I use a J-Pole made out of ladder-line.
It is attached to a fiberglass bicycle flag pole. It
doesn't need a ground plane. This should work well on
an ATV. You may even already have the fiberglass flag
as is required when riding on many beaches.

This thing is much easier analyzed as a distributed network
transmission line. At the resonant frequency where I2 is 180
degrees out of phase with I1, assuming |I1|=|I2|, common-mode
currents are eliminated so there are none available at 'B'.
On frequencies where I2 is not 180 degrees out of phase with
I1, common-mode currents flow on the outside braid of the trap
and thus continue to flow down the antenna wire at point 'B'.

The key to understanding the operation of this trap is to
realize that current ceases to flow on the outside of the
trap braid at the trap's designed-for frequency.

Hi Jim

Keep in mind that if you are doing a lot of off-road the high gain antenna, normally optimized to radiate towards the horizon, ends up skying or firing most of it into the ground. This is why for example a 1/4 wave is great in city "canyons" and mountainous areas. The "all around" radiation has a better chance of reflecting off something above you.

You can always make a wire etc counterpoise for the 1/4 wave.

Any effective collinear is going to be big to do well. Its also going to be somewhat whippy. A 1/2 over 1/4 or 5/8 over 1/4 you can work out how big that will be. This kind of antenna will need a ground plane so maybe you could look at a 1/2 over 1/2 voltage fed. This will be over 6ft long!

I saw a 1/2 wave voltage fed antenna once made up like a slim jim. It had two parallel spring steel conductors about 4-5ft long and half n inch apart. It was very effective. It was fed about 2" from the bottom (the lower 1/3 of the antenna being the matching section - which also raised the antenna height some) If you want to experiment (with something that will eventually break) consider some 300 ohm ribbon inside 3/4" plastic conduit.

Apologies for not giving any specific brand details. I tend to make my own...

Cheers Bob VK2YQA

Thanks to both Merlin and to Cecil. Well, I thought that a 1/4 wave
would rely on a good ground plane more than a 5/8 wave antenna would. I
will have to consider that.

As for a J-Pole, I really don't think that is a high-gain antenna , is it ?
My thinking has been that it is primarily a dipole, mounted vertically.

Thanks again !!

A 1/4WL is not a high-gain antenna either. Neither
is a 5/8WL with a non-optimum ground plane. A J-Pole
has essentially the same radiation pattern as a
1/4WL ground plane but it doesn't need a ground
plane. If you want gain and are willing to provide
an optimum ground plane on your ATV, then there are
phased-array gain antennas available, e.g. the
Diamond 97 inch NR22L with an advertised gain of
6 dBd.

Thanks Wes. That seems to be the document that serves as the root reference for most discussion, though someone may have described the circuit prior to that document.

I searched the net for the paper to no avail, so thanks, it is most helpful, and very kind of you to fetch it out and scan it.

There are some noteable inconsistencies betweent that document and the other two you posted.

I also think that there are significant issues in N3GO's paper, more to follow.

I will do some modelling of the coil configurations for which he reported measurements.

Owen

I designed a trap using VE6YP's calculator. The trap was designed for
resonance at 7MHz, used Belden 8262 (RG58C/U) on a 50mm dia former. I
assumed Q of the inductor is proportional to f^0.5, and that Q at 1MHz
was 60, which gives a Q of around 160 at 7MHz. I think the Q
assumptions are realistic considering the effect of the braided
conductor and proximity effect of the close space turns.

Analysis of that trap using my model suggests that at resonance (which
is 2% lower than predicted by the calculator) |I1|<<|I2|, |V2| is a
little less than |V1|. The coax is not a 1:1 impedance transformer or
current transformer in any way, shape or form. If one examines the
standing wave on the coax, at trap resonance, a current minimum and a
voltage maximum occur the A end of the coax.

>
>The key to understanding the operation of this trap is to
>realize that current ceases to flow on the outside of the
>trap braid at the trap's designed-for frequency.

I suggest that at resonance (if that is what you meant), impedance is
a maximum, I1 becomes small, |I2|>>|I1|, and the current flowing on
the outside of the coax (I1+I2) is not zero.

Owen

A good choice for vehicles without adequete ground plane would be the
!/2 wave end fed antenna that does NOT require any ground plane.

One such antenna here: www.comtelco.net A1812A 44

Also can be orderd with the heavy duty .125 dia whip, The whip is about
39" tho.

The radiation pattern is the same as a 1/2 wave dipole and much the
same as the
1/4 wave whip.

Sorry, I got phasing coils and traps confused in
my thought processes. A trap is probably about half
of a 180 degree series resonant phase-shifting coil.

Also please note that points 'A' and 'B' are reversed
between your drawing and N3GO's paper.

The main thing to remember is that the forward wave
on the standing wave antenna is reflected by the
trap. For the voltage and current phasing to be
correct at the feedpoint, the trap must present close
to an open-circuit to the forward wave.

Good point, Yes, very good point.

No-coders must go to the end of the line for refreshments at meetings.
Code hams must be served first and should take more treats than they want
and need. When all the code hams are served and there is nothing left,
no-codes get the left-over Coffee grounds and Cookie crumbs. This will
teach no-codes that by working harder to be better hams, they will not
only get more radio spectrum, they'll also get treats at club meetings and
won't have to sit on the floor with an empty stomach.

No-codes can still dig their treats out of garbage cans and toilet bowls
if they wish, but they'll have to share them with any CB'ers that might
also be at the meeting.

So what appliances does everyone hope Santa brings them for Xmas?

HF, VHF, UHF, KENWOOD, YAESU, ICOM, Cobra?

I couldn't think of anything for myself, so I hope I just get a some
componants and a new soldering iron for projects so I can keep moving
forward in ham radio.

No, No, No. I'm full of love. If I didn't care for you people I wouldn't post help tips to inspire you all to be better radio amateurs and assets to our radio service. I'm here to lead and guide everyone to a higher level Ham-dom.

Now, many of you are like alcoholics and until you realize you all need help, you're not going to let me help you. But that's OK, I don't mind pointing out everyone's faults & deficiencies. It's actually quite fun.

It's like watching cockroaches scurry from the light.

Golly Gosh Barry! Mention meters, and you pop right up.

FWIW, from the Merriam Webster dictionary:

Main Entry: me&#65533;ter
Function: noun
Etymology: French m&#65533;tre, from Greek metron measure
: the base unit of length in the International System of Units that is
equal to the distance traveled by light in a vacuum in
{frac;1;299,792,458} second or to about 39.37 inches -- see METRIC SYSTEM
table

That antenna is a pretty good choice. I'd add that if Jim wanted to
try a 1/4 wave it might work, because he could catch a ground plane through
the frame. That is where most mobile antennas get their "ground".

2602. more input and info on coax traps

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-19 01:57:08 UTC
From: "carkenord@juno.com" <carkenord@juno.com>
Message-ID: <1163901428.186910.309550@h54g2000cwb.googlegroups.com>
Source record: 49276

There is currently a thread on coax antenna traps.

In this thread, reference was made to the coax trap article by
O'Neil N3GO.

"Trapping the Mysteries of Trapped Antennas"

I have some stuff in my old antenna scrapbook that supplies a
follow-up/correction to O'Neils article. Evidentally there were a
couple of errors in the article, including an error in the actual OD of
the coil form used versus what was printed in the article. The
follow-up/correction is published on page 8 of "Ham Radio"
magazine February 1982.

I have further info regarding magazine articles that were published
pertaining to coax traps.

Larry East, W1HUE published a full-length article in QST "Antenna
Trap Design Using a Home Computer". This article DOES cover coax
traps.
Unfortunately, I don't know exactly when it was published, tho I do
know that it was later than May, 1986. A handwritten note on this
paper says "ARRL-supplied disk filename is EAST.BAS"

In June 1984 QST "Strays" column, there is a correction, relating
to some previous coax trap article in QST.

In May 1981 QST, Robert Johns, W3JIP has full-length
article....."Coaxial cable Antenna Traps"

In Dec. 1984 QST there is full-length article by Robert Sommer
N4UU....."Optimizing Coaxial cable Traps"

In March 1984 QST is a letter....possibly Technical
Correspondence.....captioned "Coax Antenna Trap Design". Written
by Frank Noble W3MT. Noble presents some math and formulas, etc.

In Aug 1985 QST in Tech Correspondence are 2 articles, titled
"Coaxial Cable Traps" .

In Dec 1980 Ham Radio Horizons, Robert Johns W3JIP has full-length
article "Three band Trap Vertical".....in which he builds and uses
coax traps for a vertical.

In Nov 1983 QST Robert Johns W3JIP has full-length article dealing with
coax traps, titled "Dual Freq. Antenna Traps".

In Aug 1984 of CQ magazine is a full-length article by Cornelio Nouel KG5b....."Exploring the Vagaries of Traps"......talks of coax traps.

When I was in the Air Force our helical SATCOM antenna got trashed. We put together a pair of Yagis made of 2x2s and solid ground wire and a phasing harness. When we first put it together we thought we had really messed up but then we reversed the connexctions on the harness we were able to get a solid signal. later the antenna was improved on and the crossed Yagis became our antenna of choice. New and improved version was made with aluminum rods and a fiberglass boom and the driven element became a folded dipole with a hairpin match. We were in the middle of an operational readiness inspection and the SATCOM guys got special recongnition for adapting to the situation. The antenna does have its limitations comared to the helix. The helix is significantly more broadbanded.

1) The king (Soloman) never cut the baby in half. He directed it be done in
order to find which of the two women's baby it really was (the real mother
opted to give it to the other woman to save it's life.. so Soloman gave it
to the real mother.)

2) Soloman was widely (and is still) revered as the wisest of kings.

In the case of Slow Code, he actually intends to cut the baby in half.

> 2) Soloman was widely (and is still) revered as the wisest of kings.

In that sense, he greatly differs from Slow Code.

jawod wrote:
> Please help a newbie. Can I get a good definition of "common mode"?
> I've been reading ARRL pubs but can't seem to get my head around this
> concept.

First understand differential currents as occur in
transmission lines. The two differential currents
in the two wires are equal in magnitude and 180
degrees out of phase. This is the ideal case for
a transmission line and differential currents
average out to zero, i.e. equal currents flowing
in opposite directions.

Common-mode currents are the currents left over
when the average of the total currents is not zero.
Icm = (I+ + I-)/2

From the IEEE Dictionary: "common mode signal -
The average value of the signals at the positive
and negative inputs of a differential input waveform
recorder. Vcm = (V+ + V-)/2"

Holy Cow!!! N2EY finally takes a stand!

Now where do you stand on the K4YZ outrages?

2615. OT Operating question

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-19 14:22:31 UTC
From: John Ferrell <johnferrell@sprintmail.com>
Message-ID: <8dp0m2dr038a9ororim4hkuomuesg8k9p0@4ax.com>
Source record: 49289

I have lost track of the year I received my Ham License. I have known for a long time that I no longer had the info but it seemed a non-issue until last night. I heard quite a few stations on 20M in the Sweep Stakes Contest. I usually make a few contacts just for fun when I encounter a contest. I was unable join in last night because one of the information bites required was the year of license. I suspect the FCC and the ARRL no longer have the data. I am disinclined to intentionally lie. The best I can do is make a guess of 1960.

Does anyone have access to call books around that time? It was a long time before I could afford a call book...

BTW, I received my W8 call when others were getting K8's.

I'm in the same boat, I've lost track of when I got my Novice ticket,
it was "around" 1953. Or maybe it was 1954 . . or was it 1955? Does it
really matter?? No. Next time pick a date out of your hat and enjoy the
contest.

the arrl has taken pity on you real ot's whos memory is failing... they have stated in the past that they don't care if you use the proper year or not, just pick one and stick with it for the contest. they won't check, nor will anyone be penalized for using the wrong number.

Wouff Hong ???
Rettysnitch ???
WTF are we in the 19th Century here???
Baaaaaaaaa hahahahhahahahahhahaha!!!!!!!

Jeezus H Christmas on a rocket powered sled at the Nevada test site
will you OBSOLETE hams PLEASE join the 21st century.

I mean consider that the terms Wouff Hong and Rettysnitch
DO NOT even appear ANYPLACE on or within Wikipedia!

That alone should tell you something! (..of course now you
can be some crusty old fart, cloistered ham radio nerd or
some asshole who took the "Bash Book" route to get his ham
license will now dash up and create an entry in Wikipaeda
just to inflate his own ego and asscheeks and claim he did
something.....go ahead, be my guest! In the meantime I'm
heading back to 20 Meters to have some fun with the contest
freaks. I made up a callsign and semi-rare section and these
CLOWN-testers are beating a path to my speaker to work me
just so they can see their callsign in print in some half-ass
magazine from CT. How F-N pathetic!) ---> PFHBLTTT!!!!!!!!

ps: you should have seen how many DX clowntesters I duped
a few weeks ago using a "creative" callsign, section and running
10 watts into the 40M dipole instead of the beam...suckers!

John,

I had excellent response from ARRL when I asked them about my
license. But even better, there is a guy who has every call book
printed, I believe, who will look you up and determine the first book
that you were listed in. He is W3HF, Steve Melachrinos, and can be
emailed at: W3HF@ARRL.NET. He can be a bit slow on response, but he
WILL get back to you.

I tend to believe that right before you die in a fire is as bad as it can
get, but that's just me. "Assnated"....just exactly what is that? Is that
like when a big fat girl with a smelly butt tries to smother you to death?

Hey Roy,

I share your dilemma with the OT crossposters. I also used Thunderbird, and while I like the interface, it hasn't been all that great at getting rid of the trash.

You might want to try Xnews. I downloaded it this weekend, and have been pretty impressed so far.

I'd note that the interface is a lot different from T-bird, and that its filters are solid, but filter across all of netnews unless you go fairly deep into the program. That's okay by me, though.

If you want to do it the simple way, you hit "K", and enter how many days you want the poster to go away. If you want them to go away foever, you type in "0".

Oh, and it's free.

Mark, you cannot expect others to take you with a grain of salt if you don't expend the energy in a grain of salt to express yourself. You expect others to stoop to your level of comprehension. Why can't you elevate your level of expression to that of the rest of the world?

At present, you are doing the "crappie flop"....flopping around on the deck with no purpose, and expecting the rest of the world to figure out your intended meaning.

<johnferrell@sprintmail.com> wrote:

>I have lost track of the year I received my Ham License.
After considering the advice here, I think the date remains a
non-issue. If asked I will claim "about 1960". It is a little
embarrasing that I have been a Ham that long and have contributed so
little. Early on I appreciated the welcome I received from so many
Hams. Nearly all were older than I. There were those who had no time
for kids or new Hams. I remember they were there, but no details.

I do remember my mentors.

Is the following information available?

1. Compared to a 468/f CF dipole, what is the length
of the trapped dipole wire between the traps at resonance?

2. Compared to a 468/f CF dipole, what is the
resonant feedpoint impedance of the trapped dipole?

2651. Replacement seal for antenna rotor

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-20 18:36:42 UTC
From: N4aeq <tucker@conninc.com>
Message-ID: <1164047802.515893.239880@e3g2000cwe.googlegroups.com>
Source record: 49325

I picked up several old channel master antenna rotors for use with
light weight beams, they check out ok but the top seal on both motors
is cracked and needs replacement.
Has anyone found a homebrew way of making or find a
replacement for the rotor seal?

well thats WHERE the problem lies, if the retards would keep the thread in
the Ham Radio NG things would be fine. After reading (a few of) the
messages, it makes me wish ham radio would die out. They complain about
'qual;ity' operators and CB'ers but then they get
here and act worse that the worst. And yes I'm cross posting this message so
that ALL the
ham radio retards can see it, with the hopes (but it seems these shit
stains have NO CONSIDERATION for other people) will STOP cross posting to
NG's that have no
bearing on their 'debates'

Quite a few of us are but we have been invaded by the idiot squad lately. A carefully made kill file will solve the problem and make the newsgroup much nicer. I have a friend who is writing a patch fpr IE that will allow you to kill entire threads according to whom initates it. I will make it available as soon as I get it. Most of the juvenille behavior is a result of those with no true interest in amateur radio, they just want to stir the pot and be heard kind of like those who yell obscenities on the air just to hear peolpe respond.

You are going to need something rugged if you are out in the woods. I made a
J antenna from a couple of old CB SS whips many years ago. I drilled a block
of metal with 3 holes 2 on 1 side and 1 on the other to fit the threads on
the antennas. The 2 holes on one side got the 3/4 wl and the 1/4wl section
the hole on the other side mated with a big spring mount. I believe this was
modeled after the Super J as seen in the ARRL handbook. This antenna mounted
on a VW dune buggy survived contact with many overhanging branches. This
antenna got out a lot better than the 1/4wl antenna it replaced. I think
this was mostly due to its added hiegth rather than any significant increase
in gain.

No, No, No, You are all Heathens!!!!

I know the Bible. I read it every Friggen day while I listen to Code. My
favorite Bible passage is an End-Times passage and I'm actually mentioned
in it. It's found in First Hiram Chapter 2, verse 73:

"and Slow Code, servant of the Lord, smote the Lids with his
cattle prod and the Lids were healed. All that saw were
amazed and fell to the floor and gave thanks to Slow Code
and the bands were made clean that day, and many CB'ers were
also converted. And they began preaching and speaking in CW"

Try Larsen antennas, their "OM" series of mobiles
1/2 wavelength, are end loaded-- Ideal for
fiberglass , and low amounts of metal. Works
great on Broncos, and Blazers, and other
non-metal frames! try
http://www.radialllarsen.com/docfiles/ASB7/Pages/72.pdf

I was never really interested in covering the whole band , just the first
1.5 Mhz or so. The SWR was comparable in this area on both antennas. The
Yagi was easier and cheaper to build.

>
...

I have put some notes together on a draft page proposing a
mathematical model for these traps.

The draft is at http://www.vk1od.net/coaxtrap/index.htm .

This is a different approach to any that I have seen, principally
because it treats the coax section as a transmission line (as I
believe it is). That is not to say it is correct, so if anyone can
identify errors in the document, I welcome their feedback.

I have not constructed and measured the example trap. Construction is
easy, I just don't have equipment to perform high accuracy
measurements of RF complex impedances up to around 100k.

Comments appreciated.

I can only assume that you purchased a cheap Far East import / clone part.
Putty knife.

Antenna Specialists (now owned by PCTEL) made the best in the industry --
"On-Glass"&#65533; product
http://www.antenna.com/
http://www.antenna.com/product_overview_detail.cgi?id_num=10456&styleid=6

just like electrolytic capacitors -- Far East again doesn't get the formula
or designs right.
http://www.badcaps.net/
http://news.com.com/PCs+plagued+by+bad+capacitors/2100-1041_3-5942647.html
http://cquirke.mvps.org/csxcaps.htm
http://en.wikipedia.org/wiki/Capacitor_plague

Consumer amateur doesn't know that there is difference -- PCTEL, like many
mfg. is slowly eliminating antennas below 440 MHz -- in favor of 800 MHz and
higher.

Exactly right. The A.S. patent was strong and forced "would be imitators" to
come up with 1/4 wave designs that gave the on-glass concept a bad name.

Or, if you're speaking of a rain cap skirt, get a roof vent pipe weather
skirt from plumbing supply that is a snug fit on the mast and trim as
necessary. They are designed for outdoor exposure from the git-go.

2686. Looking for reference: modifying CB whip for lower bands

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-21 19:15:13 UTC
From: "Al, N1AW" <awoodhull@hampshire.edu>
Message-ID: <1164136513.019153.223950@f16g2000cwb.googlegroups.com>
Source record: 49260

Some years ago I read a magazine article on modifying a base-loaded CB magnetic mount antenna for lower bands. These antennas have a coaxial mount -- the bottom of the coil is grounded and the feed connection is made to a tap on the coil. By rewinding the loading coil (more turns of smaller wire) and properly connecting the tap you can get an antenna that is resonant and provides a good match -- as I recall, the article described doing this for bands as low as 40 meters.

I made one that worked well on 15 meters. I know it's not as efficient as a bigger antenna, but it is easy to put it on a car roof for casual operation and you can go under bridges that you'd have to detour around with a full size antenna.

Does anyone remember this, can anyone send me a reference, or, better, a photocopy of the article? It was probably in 73, it could also have been in CQ or Ham Radio. Somewhere along the way I decided I just couldn't save all my old magazines, they are all long gone mow.

73, Al, N1AW

2704. Questions on broadband antenna design (e.g. T2FD)

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-21 21:57:46 UTC
From: "C. J. Clegg" <reply.in.group@nospam.no>
Message-ID: <pan.2006.11.21.21.57.45.452725@nospam.no>
Source record: 49128

I have a need to design and erect a single antenna that covers a number of government frequencies from around 4 MHz to around 9 MHz. It needs to cover a radius of around 300 miles, give or take, and so an NVIS installation seems indicated. It cannot use any sort of antenna tuner and must be fed with a single coax of 50 or 75 ohms. The frequencies to be used are scattered here and there within the 4 to 9 MHz range and so I can't just put up a trap dipole or multiple-legged dipole with legs cut for different frequencies (well, I probably could, but it would be impractical).

I've been looking at the T2FD (tilted terminated folded dipole) design or some variation thereof. I realize that these antennas are a compromise at best, and suffer from varying degrees of inefficiency at various frequencies within their design range. However, it seems they are the only antennas I can find (so far, at least) that claim to cover the desired frequency range with a single coax feedline and no tuner.

I don't need 3 to 30 and so I'm not inclined to spend $200+ on the B&W variant.

I think I have ample space and trees located at reasonable endpoints to put up a model that's at least 150 feet long, perhaps longer. On the other hand, if shorter is just as good given the desired frequency range, that will be easier to do.

Every indication I've found on the web seems to say that 75-ohm coax, a 4:1 balun, and a 390-ohm noninductive terminating resistor will give a reasonable match across the design range of the antenna.

So, my questions are...

1. How do I determine the overall antenna length that will give me the most efficient (which is to say, the least inefficient) performance across the 4 to 9 MHz range?

2. How do I determine the minimum power rating for the terminating resistor for an antenna that will be driven by 100 watts maximum?

3. Where can I buy a few noninductive terminating resistors that meet the power rating determined in (2)?

4. I would rather feed it with 50 ohm than 75 ohm, since I think the transmitter would be happier with that, and I'm told that for best results I should use as much as a 10:1 balun for that, and a 470-ohm terminating resistor. Would I be better off doing that? Where can I buy a 10:1 (or other oddball ratio) balun?

5. Are there other antenna types I should consider? A discone might work over the frequency range but it's vertically polarized with a relatively low radiation angle so I suspect it isn't much good for NVIS. Anything else?

Thanks...

I don't have the technical data you ask about, but I do have experience in installing systems such as you describe. We simply used the commercially available B&W broadband loaded dipole. Our customer typically ran 1KW into the antenna, and was very happy with the price/performance. In spite of the negatives often cited about the antenna, it is a very effective compromise for some situations.

The other type of antenna we used was an open wire fed dipole with a rather hefty remote antenna tuner. It's performance was better than the B&W, but our customer preferred the B&W for reasons of cost and ease of installation.

Good afternoon, Wayne.

That's certainly an option, but as I said I would rather not spend $200+ unnecessarily, especially since I already have all of the necessary materials except for the terminating resistor.

Anyway, the BWD-65's lower end is 4 MHz, and some of what I've read about T2FD antennas seems to indicate that near the low end is where efficiency is worst (inside of the design range ... outside of the design range it is MUCH worse).

I suppose I could use the BWD-90 but I have a hard time understanding how they get all the way from 1.8 to 30 ... that seems very, very wide even for a T2FD antenna (I suppose it's a moot point, though... I'm sure it will get to my upper limit of 9 MHz nicely).

As an aside, I see from the latest HRO catalog that the BWD-20, BWD-45, and BWD-65 are all $220 and the larger / longer BWD-90 is only $200. Why do you all suppose the bigger one is cheaper than all of the smaller ones?

The other reason I don't necessarily want to use the B&W is that with a
little freedom of design parameters and my limited frequency range of
interest (don't need 1.8 to 30 or even 4 to 30, just need 4 to 9), I was
hoping I could adjust the design characteristics to minimize the
inefficiency and mitigate the negatives.

Good evening, Dave.

I guess I forgot to mention ... this antenna needs to be omnidirectional
or nearly so. Anyway it needs to be NVIS and I suspect a log periodic
wouldn't work well in that configuration.

>the 4 to 9 MHz range?

A range greater than 2:1 means that you're almost certainly going to run into at least one operating frequency at which the antenna itself is an extremely difficult load (very low, very high, and/or very reactive) and that most of your power is going to end up in the terminating resistor.

One way to evaluate different lengths would be to model out such an antenna using NEC2/NEC4 or the like. Vary the antenna-length-to-operating-frequency-wavelength ratio, and evaluate the amount of power radiated vs. the amount of power dissipated in the termination resistance at each. Then, given the specific frequencies at which you actually want to spend most of your time operating, figure out which length gives you the best overall efficiency for your own operating conditions.

At a guess - and it's just a guess - I think you might get reasonably satisfactory results by choosing a length which would give you a folded dipole that's resonant right in the middle of your 4-to-9 range, or perhaps a bit longer than that. You'd avoid the "too short to load up efficiently" problem at 4 MHz, as well as the "a full wavelength long, and thus presenting a high feedpoint Z" problem at 9 MHz.

>2. How do I determine the minimum power rating for the terminating
>resistor for an antenna that will be driven by 100 watts maximum?

Ummm... I'd say that you'd need a resistor capable of dissipating 100 watts, continuous, when used under ambient-free-air conditions in the highest operating temperature you'll encounter. I'd probably de-rate it by at least 50% (200 watt resistor) just to be sure, especially if you're going to be operating RTTY or any other high-duty-cycle mode.

One of the unfortunate things about a T2FD is that there are going to be frequencies where most of your power warms up the feet of the birds perching on the termination resistor :-(

>3. Where can I buy a few noninductive terminating resistors that meet the
>power rating determined in (2)?

You could probably stick a bunch of Caddock MP9100 power film
resistors, wired in series, on a chunk of aluminum heatsink and make
it work OK. Caddock sells direct, I believe, and if I recall
correctly Mouser carries many of their parts.

You might ask B&W if they'd be willing to sell a "replacement" for
their termination resistor assembly.

Too much money.

Anyway, eventually (not right away) this antenna is going to be used in an ALE network and I rather doubt that autotuners work very well in that kind of an environment.

Not too useful unless you need the directivity as well.

The loaded folded dipole idea is actually quite efficient if you stay above
the "knee" frequency. This is about .5 wave at the lowest frequency.

Anything over about 90 feet should work. 125 would be just about perfect.
And no, they DON'T have bad spots....usually they stay under 2 to 1 across
a fairly wide band and efficiency stays good above the knee frequency.

Model it, if you want exact performance figures.

Tried WD-40 ?? It isn't just a lubricant,
but also does wonders as a SOLVENT ! great for
removeing glues, and other cruds stuck on items
(not just metals)! may have to get a small area
loosened, then spray it with WD-40, and let it
set. Give it a couple hours, peal and then
reapply to any areas still sticking! Also works
on Bumper Stickers, and sticky decals on former
company vehicles! Good Luck. Jim NN7K

Yes, as I said, I don't have the technical data. I just wanted to cite
experience that would indicate that you can most likely be successful in
using an antenna such as a T2FD for your application. Good luck.

Good evening, Dave.

But, isn't there another frequency, around 1 full wavelength at the
operating frequency, above which efficiency starts to go to pot again?

125 ft (which you suggested in another message) is a full wave at
something a shade under 8 MHz, well within my upper limit of 9 MHz. So,
how will a 125-foot T2FD operate in the range of, say, 7 to 9?

Dear "C. J. Clegg"

You are looking for an antenna for commercial or government use.
Several on this group are professional engineers (P.E.) who will be happy to
design whatever you wish in the way of an antenna.

Please provide an actual E-mail address and a verifiable name, and I
will be pleased to provide a quotation.

Regards, Mac N8TT and also a P.E.

Apologies for the overlap into an amateur group.

Yeah, this is exactly what I'm trying to avoid, by careful choice of
design parameters like length, resistor value, balun type. Feeding the
antenna with 100 watts and having all 100 of those watts dissipated in the
resistor, at any frequency within my range of 4 to 9, isn't going to work.
If I can't keep the efficiency above 50 percent across the range, then it
probably isn't going to be worth doing.

Not better hams ... just slo-o-o-wer hams! Morse is the most inefficient means of communication we have. A kid can burp-speak the alphabet faster than you can send it in Morse.

The government, long a believer in subsidizing the most worthless schemes in the world, abandoned Morse totally about ten years ago. With the exception of a few folks who eavesdrop on primitives in the third world, nobody I know does Morse for money any more.

There's is absolutely no nobility in Morse Code. IT'S YOUR FRICKIN' TOY! It's Tickle Me Elmo with a 40-foot pole up his ass! Here's what you do: Leave the library, buy a computer of your own, find a kid to teach you how to use it and get on HF the _right_ way.

Besides, you have the wrong initials for deciding which flowers to plant in Radioland. A certain F.C.C. does that job -- exclusively.

Hi OM,

By turns, you've painted yourself into a corner when we add up this
wish list. Worse yet is the complaint you anticipate with:
>If I can't keep the efficiency above 50 percent across the range, then it
>probably isn't going to be worth doing.

3dB is hardly they abyss of performance, and, in fact, you would
probably be hard pressed to notice it. If you could, your dream
antenna (for the price you are willing to pay) would automatically
qualify for the dung-heap.

When you lead with your chin with:
>It cannot use any sort of antenna tuner
this simply breaks the camel's back. Also, come to terms with there
is also no such thing as a miracle BalUn.

In traditional engineering, there is the adage that a well defined
problem contains its own answer. You can reconcile facing abject
failure by falling back and building a cost/benefit analysis of all
the characteristics of your desired antenna. It should take more than
half an hour to come up with the price tag. You may also discover
that you can live without some of those restrictions and you might be
able to live with a tuner - generations have survived and flourished
under similar circumstances.

Good morning, Richard.

I was hoping to mitigate all of that by restricting the frequency range. I'm not asking for 1.8-30 or even 4-30, but 4-9.

Can a T2FD antenna not be made 50 percent efficient across that restricted frequency range?

The 50 percent efficiency floor is somewhat arbitrary but is driven by the fact that some of the users of this antenna are going to be using power levels as low as 5 watts. That's hard enough to do with a cut NVIS dipole, without throwing an inefficient antenna into the mix.

The inability to use a tuner is driven by the fact that eventually, these antennas are going to need to be usable with ALE radios. I don't know very much about ALE (yet) but I have a hard time imagining an autotuner that is consistently fast enough to use with ALE. Also, the users of these antennas are, like me, going to be paying for them out of their pockets. Few if any of the potential users that I know of today can afford to buy an autotuner. I know I can't.

If it can't be done, then it can't be done. I'm realistic enough to accept that and move on to something else, or drop the idea. It just seems to me that within the limited frequency range, something like that should be possible with the right choice of design parameters.

An LP near ground also functions as a NVIS antenna, a broadband NVIS antenna.

You will need more space than the B&W for example; but, if space is available a six or seven element design should work just fine.

Also, any TERMINATED TRAVELING WAVE designs should work. A 1/2 wavelength at 3 MHz terminated in 600 ohms and fed with a good 9:1 balun would do as well.

/s/ DD, W1MCE

BTW: it is proximity to ground and horizontal polarization that causes NVIS

Narrowing the frequency range isn't going to help much with the design.
I'm no expert, but if I read my signs correctly, the T2FD has the same
ups and downs in SWR as does most other multiband antennas. IOW, it
relies on frequency harmonic relationships.

Cebik has a good web page at:

Looks like a very useful page. And, the section down at the bottom
labelled "Terminator Resistor Losses" tells the sad tale. With both
of the designs Cebik modelled, the power loss into the termination
resistor is only rarely less than 50%. For the longer of the two
models (165', wide spacing) the losses between 4 MHz and 9 MHz range
from 4 dB to over 6 dB, with an average loss of around 5 dB.

It looks as if it might be possible to model/design a T2FD with an
intermediate length and spacing, which might result in average losses
in the 4 - 9 MHz range which are lower than either the 100' or 165'
models. However, from the shape of these curves I doubt that you'll
get the average loss down much below 5 dB. Even getting the average
loss down below 3 dB looks as if it won't happen, and I don't think
you're going to ge the worst-case loss down below 3 dB at all.

You might want to go back and reconsider the possibility of using a
feedpoint-mounted autotuner - in particular, one which has a
frequency-based tuning memory capability and fast-retune feature, and
which does not require a large amount of RF power to initiate a tune.
Some such tuners require only a couple of watts of RF in order to
tune, and can re-tune to a previously-memorized frequency and
match-set within a couple of hundred milliseconds. I believe that an
autotuner of this sort would be compatible with low-power ALE, as long
as you had "pre-programmed" it by doing a full tuning cycle at each
frequency in the range you're interested in, and given it a chance to
search for and "memorize" a suitable match.

The lady who has demo'ed ALE at a number of hamclubs in my area
(regrettably I don't recall her callsign) uses an ALE-equipped
military radio, and a Motorola (or Harris?) longwire autocoupler
hooked to a random length of wire and a counterpoise.

Hi OM,

That has been evident from the beginning. Still and all:
>The 50 percent efficiency floor is somewhat arbitrary
Exactly. It is just such arbitrariness along with competing,
conflicting restrictions that leads to self-defined failure tacitly
accepted with:
>If it can't be done, then it can't be done.
However, it has been done, and without the unnecessary complications
of forcing ANY design to span an octave without a tuner. Hoping that
a resistor will solve this is dope-slapped with the expectation of
efficiency.

>some of the users of this antenna are going to be using power
>levels as low as 5 watts
So what is all this angst about efficiency? Pour 100W into any hank
of wire and you will achieve at least that. Or do you mean that the
design you are looking for will be used as a model for others? If
that is the case, more the pity that the requirement of having a $25
tuner is an unreasonable expectation of Amateur radio operators. I
cannot imagine they will spend less on those resistors....

Good afternoon, Richard.

Actually, what I mean is that some, including me, will be using 5-watt
radios (Yaesu FT-817). If the option of pouring 100W into any hank of
wire was available to all, the issue wouldn't be critical. It's not,
so it is. :-)

> more the pity that the requirement of having a $25
> tuner is an unreasonable expectation

Remember the ALE requirement. I am only just now becoming convinced that
some autotuners might work for ALE. I'm quite certain manual tuners won't.

There's another approach to the antenna that you might want to consider, _if_ the ALE ranges are limited to a few (say, no more than four or five) and aren't too wide (say, no more than perhaps 5% of the center frequency).

If your usage pattern fits this model, then you could construct a multi-wire "fan" dipole array... simply a set of individual wire half-wavelength dipoles, each cut for the center frequency of a given ALE range, spread apart physically, and fed from a single coax at a single feedpoint. They can be spread vertically (e.g. hang the longest one as a flat-top from a convenient set of trees, suspend the next-shortest beneath it on 6" spreaders, hang the next-shortest on another set of spreaders, etc.) or horizontally (run one north/south, another east/west, etc.).

There will be some amount of coupling/loading between them, so you'll need to trim them for lowest SWR once they're installed, and you may find the SWR bandwidth less than you'd get from individual dipoles. Coupling/loading is greater for the vertically-stacked case, and less for a star-like horizontal pattern (which takes more space and more trees or etc., of course).

The nice thing about this approach, if it's suitable for your needs, is that the losses are quite low. The wire which is resonant on the band in question loads up and radiates, and the other wires (which will typically have high, reactive impedances) accept very little current. No lossy termination resistor is needed.

I've been using a three-wire fan dipole (5" vertical spacing) cut for 40/20/10 for several years, with very satisfactory results.

This approach won't give you continuous coverage of your 4:9 range... unfortunately I can't suggest any which would, which don't require an agile tuner/transmatch and which don't introduce high losses in some portions of the band.

I seriously doubt that. What you are describing is a sacrifice in
Link Quality for the sake of not using something like a fan dipole
which would immediately satisfy every requirement and fulfill mission.
How this is justified with
>multiple-legged dipole with legs cut
>for different frequencies (well, I probably could, but it would be
>impractical).
forces a new meaning to the word impractical. Perhaps you would care
to elaborate how the simplicity of two extra wires has been trumped.

I'll try, though from the tone of your message it sounds like your mind is made up. :-)

We will be operating on many different frequencies across the range of 4 to 9. I don't even know (yet) how many different frequencies will be in use (they won't tell me).

So I can envision many pairs of dipole elements, each cut for a certain frequency in the range, and laid out like the spokes of a wheel.

I have plenty of land here but I don't have ready supports for that kind of an array.

That's what I mean by "impractical".

I've learned a lot from you guys the last few days, though, and maybe something like that isn't so impractical ... I'll have to experiment. Perhaps an array of inverted vees on a single feedline...

It sounds to me like you have it all covered. One extra thing you can do is just have it send random words for about four or five minutes, then people can check their copy with what was sent.

Also, make sure it can send code up to 20 to 25 wpm. Some people might want to practice to be real hams.

If code is eliminated the riff-raff that will overrun the bands will drive a lot of people out of amateur radio. It's bad now even with a 5wpm code.

Back when I got my license there was alot of technical discussions, experimentation and lot of hams improving their communication and technical skills. Now with 5 wpm, convertions are mainly about appliance operating, or how someone did something stupid and burned up their rigs, things just like you can hear on CB.

No one is going to quit amateur radio because the code requirement was eliminated, maybe a couple might. It's the retards that will flood the bands afterwards that are going to drive good hams out of ham radio.

We already have one CB service, we don't need two.

Al -

There were a large number of articles during the 1970s on this subject (73, CQ, Ham Radio magazines) -- as well as conversion of CB mobile whips to 2-meter 5/8 wave antennas.

Although a significant amount of information is electronics (Internet accessible) -- there is also a considerable amount that is still available through your local library. At best, you may find an electronic index of the materials.

For example, Herb Freidman wrote a number of articles in Popular Electronics, Electronics Illustrated as well as the amateur radio journals -- yet I have to go through my local library's magazine and periodicals request network -- to get reprints of his Electronics Illustrated articles and materials.

I didn't see this. But as the size increases, the pattern tends to start
to come apart.

>
> 125 ft (which you suggested in another message) is a full wave at
> something a shade under 8 MHz, well within my upper limit of 9 MHz.
> So, how will a 125-foot T2FD operate in the range of, say, 7 to 9?

Actually, I just modelled it. The 125-foot version is very good between
7 and 9, but the SWR (with a 650 ohm terminator) jumps to 4 to 1 at 5.25
mhz. Like I suggested, you need to model your actual situation, then
build to the model.

What you want to do should be in the instruction manual that came with the network analyser. You may need specially treated cable if it is to be subjected to changing temprature. Some of the rg214 cable I use is annealed in a oven.

My mind is made up? I've repeatedly wondered why you have approached
this with a defeatist attitude.

>We will be operating on many different frequencies across the range of 4
>to 9.

Again, this has been apparent from the beginning.

>I don't even know (yet) how many different frequencies will be in
>use (they won't tell me).

That doesn't matter all that much, except to anticipate failure.

>So I can envision many pairs of dipole elements, each cut for a certain
>frequency in the range, and laid out like the spokes of a wheel.

If you re-read my posting, I've done nothing more complex than to add
TWO more wires. ALE may easily jump between 200 frequencies, but
there is absolutely nothing about that which demands a resonant
frequency for each of them.

>I have plenty of land here but I don't have ready supports for that kind
>of an array.
>
>That's what I mean by "impractical".

Then the solution is not impractical by any definition, you are simply
over embroidering the problem with a slavish interpretation of
necessity. One pair of wires cut to a low end, one pair of wires to a
high end, both pairs fed at the same point. It may take as many as
four pairs (I doubt it), but to abstract this wildly to 200 goes
beyond the pale when a skeleton biconical could easily accomplish this
with flat response (over a much larger bandwidth) with only 16 pairs
of equal sized wires.

This cage monopole:
http://home.comcast.net/~kb7qhc/antennas/verticals/Cage/cage.htm

is flat over 5 Ham bands.

This discone:
http://www.qsl.net/kb7qhc/antenna/Discone/discone.htm
operates flat over more than two octaves of bandwidth. With scaling, I can count at least 55 discrete frequencies that would fall into the 2:1 mismatch region - and this say nothing of those frequencies between them, nor of their end points which could be made to span 4 to 9 MHz.

Yes, a lot of wire, but use less wire for a rougher approximation. If you are looking at an arbitrary 50% efficiency, a 5:1 circle encompasses a lot more points for less wire.

Well, looks like most sensible people have your posts blocked, other
than myself and the uninitiated... so they never see your posts to
reply.

Me, I still find your idiocy to be somewhat entertaining... but in
time, I too shall tire of it and decide to "clean up my boards".

Thanks. I have said earlier that I considered a discone (I also considered a cage monopole but didn't mention it here) but those are vertically polarized antennas and I'm pretty sure they're not good for NVIS. Am I wrong?

I am also considering an array of inverted vees cut for selected frequencies within the range, Something like that is likely to be much better for NVIS.

Sorry if I seemed to fit all those names you called me... you say I'm defeatist, one or two others here say I'm too optimistic. Can't please everybody I guess. For the most part I do very much appreciate all the help everyone has offered here, in a thread that has grown way beyond anything I envisioned when I started it ... you guys are great. :-)

2778. 5 Radio Frequency Interference Ferrite (RFI) Reducers for Round Cables

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-23 13:48:10 UTC
From: muldawer@gmail.com

5 Radio Frequency Interference Ferrite (RFI) Reducers for Round Cables

Cut down on RFI (radio frequency interference) with this effective and easy to use clamp-type split ferrite choke core. Simply snap it over any coax cable, AC or audio cord.

Features/Specifications: Split ferrite RFI reducer for round cables
Clamp-type fitting
Uses high-performance ferrites (Nickel-Zinc) that reduce high frequency noise
Split ferrite assembly are fully enclosed in a Nylon case
Can be installed before or after product setup and assembly

Package Includes: RFI reducer for round cables

Product Requirements:
Suitable round cable

RFI filters can be pretty important when cables are run through big bundles of other cables or near strong power supplies. Put this RFI reducer on your round coax, AC, or audio cord to improve the signal quality. This Radio Frequency Interference Reducer is made with high-performance ferrites (Nickel-Zinc) to ensure a better filter process. It is small, only 1.2 inches long and snaps on in an instant.

Do any of you no-code lids remember the demonstration on Late night TV
when a couple of CW ops demonstrated and proved CW is MUCH faster than
"text messaging?" Yeah, it';s slow if you are a 5 WPM lid that has no
pride in themselves, but for REAL Hams it is efficient, and fast.

2780. CP nearly spherical

Newsgroup: rec.radio.amateur.antenna
Date: 2006-11-23 15:21:48 UTC
From: SamSvL <samsvl@nlr.nl>
Message-ID: <Xns9884A6756F505samsvlnlrnl@192.87.166.15>

Source record: 49207

I made 3 of these antennas many years ago - 10m,15m and 20m - and use
them almost daily. They are modified Radio Shack 5/8 wave base-loaded.
They work very well, and are only about 2 feet tall. It involved
re-wiring just the coil. I use a trunk-lip mount, but they also work
with a magnetic mount. I don't have the article anymore, but I believe
it was in QST (maybe around the mid-80's) .

Since his range is just slightly more than 2:1, I wonder if he can pick the
resonance so that the thing is not full wave at any frequency of interest.

Either Mouser or Digikey had 50 W non inductive resistors.

Hi Sam

If you want "half spherical" coverage for receiving a circularly polarized signal, a turnstile is probably the easiest to build.
If your requirements for sensitivity are more stringent than the turnstile provides, a quadrafilar helix is excellant circular polarization.

Jerry

Send your spec to these guys, they should be able to help you or at least
tell you whether it can be done. I hope you can afford their products.
Their tunable notch filters are very nice and might be one way of avoiding
a custom design, though I don't know if they cover your frequency.

10 signals are obsolete and are being officially dropped by most police
departments in favor of plain English. The announcement has been all
over CNN and FNN. Apparently, police professional organizations and
Homeland Security have recommended that 10 codes be dropped, and most
police departments are about to comply.

The use of 10 codes will now be the offical mark of a backward operator,
just as we have always known.

Looks normal and legal to me. The big horn antennas are probably commercial.
Very common for Amateur Radio Repeaters to share the mountain top site with
commercial folks. IRLP and EchoLink are legitimate Ham Modes

They don't like to be reminded about that contest. It shows the
difference between skilled and un-skilled. It also gets back to that
liberal political correctness thing. Everyone has to be equal, since not
everyone is good enough to rise to the top, they got to drag the top down.

Fine, then you losers don't come asking us to help you fix your radio's
after you break them. We got more important ham things we can be doing
than fixing a no-code hams broken radio.

I remember a tuner like that from the Air Force ham club. When you changed
bands you unplugged a coil and its link. Fed a big 80M thru 10M LPA.
Balanced feedline from the tuner to outside and up the tower was made of
1/2 inch copper tubing. I was impressed , but then again it didnt take that
much to impress me back then.

Near 1.5 Ghz the "Patch" antenna works well for me and my GPS receiver. I
THINK it is CP but which rotation??? Some sources indicate you have to nick
alternate corners of the radiating element to achieve CP. I don't know.

Google .com tells me the GPS patch is available at
http://users.bart.nl/users/plundahl/antenne/patchant.htm

or a 2.4 GHz version at http://www.rc-cam.com/gp_patch.htm#GPP_faq

You scale it to your approximate center freq. Good luck

I just looked up "lid" - a poor operator, one who does not follow proper procedures or sends sloppy Morse code. (Not me on either count. It's a silly insult to throw around when you don't know somebody.)

Moderator, can we rename this thread? I think "Mode Rage" sounds right.

(If it keeps going, I can claim that you're not real hams if you don't do Amateur TV at 1.2 GHz. Then what?)

There is no moderator here. Mark, however, considers himself to the de-facto self-appointed Knight-In-Shining-Armor/protector/moderator who defends no-coders against the onslaught of us pro-coders. Of course it is worth noting that Mark is the only no-coder in this group.

Mark has not mastered the art of even 5wpm and stubbornly maintains that he will never do so. He posits that he should be handed a General or above license because he feels CW is outdated. This from a guy who cannot author a cohesive sentence and who, despite many freeware spell check programs, refuses to make an effort toward rendering his third grade level disjointed posts readable.

Mark continues to assert that he is trying to clean up this newsgroup (rrap) while in reality his fifty to sixty (often more) daily posts have driven many of the previous Hams away.

When Mark blundered into this newsgroup with his trash, it was the old cliche', There Went The Neighborhood.

Of course Mark will have to comment. As Slow Code has previously noted, Mark simply cannot let a post go by without crapping on it. As always, Mark will change the subject line.
Sorry, Mork. I won't read your response. I no longer read the fifty to sixty posts you change the Subject line on.

Hi Sam

You may have alot of difficulty locating a design for an antenna that radiates a given "circular" polarization with "spherical" coverage. I consider those requirements to be entirely beyond reality. Are you planning to build this antenna or buy it *off the shelf*?

Jerry

Thanks Jeff! I'm pretty sure the article I was thinking of did not come from QST. Seib, VE3JUA found and sent to me an article from 73, Sept 91, pp. 26-28 titled "Economical Mobile HF Antenna" which is probably the one I remembered.

I'd also like to find a copy of the QST article. I used to have a complete collection of QST back to the 70's but that went away too, I just couldn't continue to store all my old magazines. The ARRL website allows a search for articles, but in most cases the article text can't be retrieved. I found a number of possibilities, but I can't tell from the titles if one of them is really the one you mentioned. If anyone on the list can help to pin this down I'd appreciate it. At this point it's not so much for the sake of the information, but just to be able to properly give credit in an article I may write about some of my own mobile antenna experiments.

Both the 73 article and the QST article you refer to mention modifying new antennas from Radio Shack, in one case a CB antenna and in the other case a 5/8 wave 2 meter antenna. Both of these types of antenna typically use a coaxial base with a tapped loading coil, and so either is a good starting point for a modification project. However, for me the attractiveness of the technique is that it can also be used with used CB antennas that can be found for just a dollar or two at neighborhood tag sales. They are not as easy to find as they used to be, but I'm sure there are still a lot of them in garages and attics.

The purpose amateur radio is communications. Real HAMs can communicate with CW and they also speak English, Spanish, and French. Those who can only speak English are stupid, idiots, turkeys, and are only wimpy HAMs. Real HAMs are also a little narrow minded, intolerant and arrogant. If you are one of those open minded and tolerant people you are not a real HAM and you are probably a liberal, left-wing, homo-faggot.

The best antennas for these modifications were the Antenna Specialists
loading coils (about 2 to 3 inches tall) Motorola also sold these under
their brand name for a few years.
The ASPS177 was that typical model.
http://wildcard.pctel.com/images_product_overview/pdf_docs/asps177_asp553_p473.pdf

You can also find these surplus as many public services are moving to higher
frequencies (and away from 150 -172) in some areas. I also find ones with

broken whips, etc. The whip replacements (K41 for this model) are available from either Tower Electronics or Antenna Specialists (PCTEL company).

Walmart.com is temporarily unavailable due to high traffic volume. We appreciate
your patience. Please check back shortly to see our great values.

Gawd, now I have to go to the store to pick one up :(
